Introduction.

The aim of this resource is to provide a complete revision guide for the Key Stage 3 Science programme of study in a format which is suited to pupils of lower abilities. There are ninety worksheets covering every National Curriculum Statement of Attainment at KS3.

Each sheet provides pupils with the key facts of a topic and also contains one or more short exercises which have been designed to check pupils’ knowledge and understanding. The sheets can be used in a variety of ways:

• to provide high quality classwork and homework materials
• for end of topic revision
• to provide pupils with the key facts of a topic that they have missed

# CONTENTS

## 2.1. Cells and cell functions.
- Worksheet 1 – Life processes .................................................. 5
- Worksheet 2 – Plant and animal organs .................................... 6
- Worksheet 3 – Animal and plant cells ..................................... 7
- Worksheet 4 – Different cells for different jobs ...................... 8

## 2.2. Humans as organisms.
- Worksheet 5 – A balanced diet .............................................. 9
- Worksheet 6 – Food and digestion .......................................... 10
- Worksheet 7 – Stages of digestion .......................................... 11
- Worksheet 8 – Blood ............................................................. 12
- Worksheet 9 – The blood system .......................................... 13
- Worksheet 10 – Moving the body .......................................... 14
- Worksheet 11 – Growing up .................................................. 15
- Worksheet 12 – The human reproductive system .................. 16
- Worksheet 13 – The menstrual cycle .................................... 17
- Worksheet 14 – Ovulation and fertilisation .......................... 18
- Worksheet 15 – The developing baby ................................. 19
- Worksheet 16 – Breathing (1) ............................................. 20
- Worksheet 17 – Breathing (2) ............................................. 21
- Worksheet 18 – Keeping the lungs clean ............................. 22
- Worksheet 19 – Respiration ............................................... 23
- Worksheet 20 – Drugs and health ....................................... 24
- Worksheet 21 – Germs and health ..................................... 25
- Worksheet 22 – Fighting germs .......................................... 26

## 2.3. Green plants as organisms.
- Worksheet 23 – Photosynthesis ........................................... 27
- Worksheet 24 – Plant nutrition ............................................ 28

## 2.4. Variation, classification and inheritance.
- Worksheet 25 – Classification – plants without flowers .......... 29
- Worksheet 26 – Classification – flowering plants ................... 30
- Worksheet 27 – Animals without backbones (1) ................. 31
- Worksheet 28 – Animals without backbones (2) ................. 32
- Worksheet 29 – Animals with backbones ............................ 33
- Worksheet 30 – Variation .................................................. 34
- Worksheet 31 – Selective breeding ..................................... 35

## 2.5. Living things in their environment.
- Worksheet 32 – A place to live ........................................... 36
- Worksheet 33 – Changing habitats ..................................... 37
- Worksheet 34 – Food chains and pyramids of numbers ........ 38
- Worksheet 35 – Food webs ................................................. 39
- Worksheet 36 – Poisoned food chains ............................... 40
- Worksheet 37 – Populations ............................................. 41

Worksheet 38 – Solids liquids and gases ........................................42
Worksheet 39 – Changes of state .........................................................43
Worksheet 40 – Elements .................................................................44
Worksheet 41 – The periodic table ......................................................45
Worksheet 42 – Compounds ...............................................................46
Worksheet 43 – Separating mixtures ..................................................47
Worksheet 44 – Metals and non-metals ..............................................48

3.2. Changing materials.  
Worksheet 45 – Changes of state ......................................................49
Worksheet 46 – Solubility .................................................................50
Worksheet 47 – Expansion ...............................................................51
Worksheet 48 – Rocks and weathering ..............................................52
Worksheet 49 – The rock cycle ..........................................................53
Worksheet 50 – Types of rock ...........................................................54
Worksheet 51 – Chemical reactions ....................................................55
Worksheet 52 – Types of chemical reaction ......................................56
Worksheet 53 – Burning .................................................................57
Worksheet 54 – Products from chemical reactions .............................58
Worksheet 55 – Harmful chemical reactions ....................................59
Worksheet 56 – Energy from chemical reactions ...............................60

3.3. Patterns of behaviour.  
Worksheet 57 – Reactivity of metals ..................................................61
Worksheet 58 – Displacement reactions .............................................62
Worksheet 59 – Acids and alkalis ...................................................63
Worksheet 60 – Acids and metals ......................................................64
Worksheet 61 – Acids and bases .......................................................65
Worksheet 62 – Neutralisation .........................................................66
Worksheet 63 – Acid rain .................................................................67

4.1. Electricity and magnetism.
Worksheet 64 – Electric current and voltage .........................68
Worksheet 65 – Series and parallel circuits .......................69
Worksheet 66 – Electrical resistance ..........................70
Worksheet 67 – Magnets ............................................71
Worksheet 68 – Electromagnets ..................................72
Worksheet 69 – Uses of electromagnets .........................73

4.2. Forces and motion.
Worksheet 70 – Speed ..............................................74
Worksheet 71 – Force and movement .........................75
Worksheet 72 – Friction .............................................76
Worksheet 73 – Turning forces ....................................77
Worksheet 74 – Pressure ...........................................78

4.3. Light and sound.
Worksheet 75 – Reflection .........................................79
Worksheet 76 – Refraction of light .............................80
Worksheet 77 – The spectrum .....................................81
Worksheet 78 – Coloured objects in coloured lights ........82
Worksheet 79 – Hearing .............................................83
Worksheet 80 – Sound ...............................................84
Worksheet 81 – Comparing light and sound ....................85

4.4. The Earth and beyond.
Worksheet 82 – Day and night ..................................86
Worksheet 83 – The seasons ......................................87
Worksheet 84 – The solar system ...............................88
Worksheet 85 – Satellites .........................................89
Worksheet 86 – The Moon and its phases .....................90

4.5. Energy resources and energy transfer.
Worksheet 87 – Energy resources .............................91
Worksheet 88 – The Sun and energy resources ...............92
Worksheet 89 – Generating electricity .........................93
Worksheet 90 – Energy changes ..................................94

Answers to exercises – pages 95-104.
Exercise 1 - Complete the sentences below.

1) It is usually easier to see movement in A _ _ _ _ _ _

2) We respire in order to produce E _ _ _ _ _ _ for the body.

3) Our ears, eyes and nose give us S _ _ _ _ _ _ _ _ _ _

4) If living organisms did not R _ _ _ _ _ _ _ _ they would soon become extinct (die out).

5) The kidneys E _ _ _ _ _ _ a waste chemical called urea.

Exercise 2 - A motor car moves but it is not living. Complete the two lists below to show which processes it does and does not show.

<table>
<thead>
<tr>
<th>Processes a car does show</th>
<th>Processes a car does not show</th>

Exercise 1 - Fill in the missing words in the passage below.

In the human body many cells of the same .................. join together to form TISSUES. These tissues then join together to form .................. An organ is a part of the .................. that has one or more important .................. to carry out. All of the organs work together to keep the body .................. The bodies of most animals and .................. are made up of many organs. Several organs working together on one large task is called a .................. For example, in the human body the mouth, gullet, stomach and .................. make up the digestive system.

intestines  type  organs  plants  jobs  body  healthy  system

Exercise 2 - Join up the organs below to their correct description.

Brain  This pumps blood around the body.

Heart  This organ makes food in a plant.

Leaf  This controls the rest of the body.

Stomach  This organ makes seeds in a plant.

Flower  This helps to digest food.
w.s.3. **Animal and plant cells.**

Name ........................................

**Exercise 1** - Fill in the missing words in the passage below.

The bodies of all plants and ................. are made up of tiny living units called ............... Some microscopic organisms consist of only a ............... cell but the bodies of most plants and animals are made up of ............... of cells. There are many different ............... of plant and animal cells. The diagrams below show the ............... that they usually contain.

<table>
<thead>
<tr>
<th>parts</th>
<th>animals</th>
<th>cells</th>
<th>types</th>
<th>millions</th>
<th>single</th>
</tr>
</thead>
</table>

**Exercise 2** - Join up the cell parts below to their correct jobs.

**Cell part** | **Job**
---|---
Nucleus | covers the membrane and gives strength to a plant cell.
Cytoplasm | controls what the cell does.
Cell wall | jelly that fills the cell, chemical reactions happen here.
Chloroplast | stores water in a plant cell.
Vacuole | absorbs light energy to make food for the plant.
**Exercise 1** - Fill in the missing words in the passage below.

Nearly all cells contain a membrane, ................. and cytoplasm. There are many .................... types of cells. They vary in their shape and ................... depending on their functions (jobs). Each type of cell is well .................. (suited) to its function. In the human .................. there are about twenty different types of cell, each has a certain .................. to do. This makes the body work much .................. than if each cell was trying to do everything.

better different nucleus size body adapted job

**Exercise 2** - Join up the cells below to their correct descriptions.

- **Ciliated cell**
  This cell is found lining the windpipe. Its surface is covered with tiny hairs called cilia. These waft dirt and germs up to the throat.

- **Palisade cell**
  This cell is found on the top side of a leaf. It contains tiny green discs called chloroplasts. These absorb sunlight in order to make food.

- **Sperm cell**
  It uses its tail to swim to the ovum. The head contains the nucleus which enters the ovum during fertilisation.

- **Root Hair cell**
  This is found on the surface of a root. Its job is to absorb water from the soil. It is long and thin with a big surface area to absorb water.
W.S.5. A balanced diet.

Exercise 1 - Fill in the missing words in the passage below.

In order to stay .................. the body needs seven main chemicals which are called food .......................... These are carbohydrates, proteins, .................., minerals, vitamins, fibre and water. A balanced diet contains the .................. amounts of all seven food types. Carbohydrates are sugars and .................. Carbohydrates give us energy quickly. Fats also give us .................. but they release it much more slowly. Stored fat under the skin also helps us to keep .................. We need .................. to help us grow and to repair damaged parts. Minerals and .................. are needed in smaller amounts to keep the body healthy. Fibre helps to keep the food moving along the ..........................

<table>
<thead>
<tr>
<th>Food type</th>
<th>Foods rich in this</th>
</tr>
</thead>
<tbody>
<tr>
<td>Carbohydrate</td>
<td>Starchy and sugary foods, e.g. potato, bread, cereals and cakes.</td>
</tr>
<tr>
<td>Protein</td>
<td>Meat, fish, eggs, cheese, milk and nuts.</td>
</tr>
<tr>
<td>Fat</td>
<td>Vegetable oils, butter, lard, cream, cheese and some meats.</td>

</tr>
</tbody>
</table>

Exercise 2 - Write down the main FOOD TYPES that each of the foods below contain.

_________________     __________________     ___________________     __________________
Exercise 1 - Fill in the missing words in the passage below.

The body needs food for a number of reasons. We need food for growth and to ................. worn out or damaged parts. We also get ................. from food. Energy is used for movement, producing ................. and to keep all of the parts working properly. Before the body ................. can use the food we eat it must pass into the blood. The food is broken down into very small soluble molecules by the ................. system. These molecules then pass through the walls of the ................. and into the blood.

intestines     heat     repair     cells     digestive     energy

Exercise 2 - Study the diagram below of the human digestive system and then carefully add the labels by choosing from the list at the bottom of this page

tongue     salivary gland     liver     gall bladder     small intestine     gullet
pancreas     stomach     large intestine     appendix     rectum     anus
**W.S.7. Stages of digestion.**

Food is slowly broken down by our digestive system. It is broken up by chewing in the mouth and by churning of the stomach muscles. Special chemicals called ENZYMES break up large food molecules into smaller ones. These molecules then slowly seep out into the blood through tiny pores in the walls of the small intestines. Any undigested food enters the large intestine where water is absorbed back into the blood. The solid waste is then passed out of the body.

**What to do**

This table gives descriptions of organs in the human digestive system. Read each description and then write down the name of each organ in the left hand column. Use the words at the bottom of this page.

<table>
<thead>
<tr>
<th>Organ</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Here the food is chewed and moistened with saliva. The food is shaped into a round ball before it is swallowed.</td>
<td>This is a tube that squeezes the food down to the stomach.</td>
</tr>
<tr>
<td>This is a bag that churns up the food. It contains gastric juice and hydrochloric acid. Gastric juice contains an enzyme that digests protein. The acid kills germs.</td>
<td>This is a very long tube that the food passes into after it leaves the stomach. Here the food is completely digested and then it is absorbed through the walls and into the blood stream.</td>
</tr>
<tr>
<td>This is a small leaf-shaped organ. It makes pancreatic juice which passes into the small intestine. This juice contains an alkali that helps to neutralise the acid from the stomach. It also contains several enzymes.</td>
<td>This organ makes a chemical called BILE which is stored in a small bag called the GALL BLADDER. The bile is squeezed into the small intestine where it helps to break up large pieces of fat.</td>
</tr>
<tr>
<td>This organ has no function in humans but it helps with digestion of plant material in herbivores such as sheep. It sometimes becomes infected in humans and then it must be removed.</td>
<td>This is a wide tube that the undigested food passes through. Water is absorbed from this back into the body.</td>
</tr>
<tr>
<td>The dried out waste food material is stored here until it is ready to be passed out of the body through the anus.</td>
<td></td>
</tr>
</tbody>
</table>

**Organs.**

liver    small intestine    gullet    pancreas    stomach    large intestine    appendix    mouth    rectum.
The blood transports (carries) substances around the body. The table below shows what the blood is made of and what each part does.

<table>
<thead>
<tr>
<th>Part of blood</th>
<th>What it does</th>
</tr>
</thead>
</table>
| **PLASMA**    | This is a pale yellow liquid in which the blood cells float. It carries:  
• waste carbon dioxide from the cells to the lungs;  
• dissolved food to the cells;  
• waste urea from the liver to the kidneys;  
• hormones from one part of the body to another. |
| **RED CELLS** | They do not have a nucleus and there are lots of them. They carry oxygen from the lungs to the cells. |
| **WHITE CELLS** | They do have a nucleus. They fight against germs that enter the blood. |
| **PLATELETS** | These are small pieces of cells. They do not have a nucleus. They help blood to clot if the skin is cut. |

**Exercise** - Fill in the missing words in the passage below.

Blood is made of a pale yellow liquid called .................. and two different types of blood cell, white blood cells and ................. blood cells. Most of the chemicals in the blood are .................. in the plasma. .................. is carried by the red blood cells. The white blood cells help to destroy any ................. (bacteria and viruses) which may enter the body. There are also tiny pieces of cells in the blood called .................. These help to clot the blood if the skin is ................. If we could not make .................. we would be in danger of bleeding to death from even the smallest of cuts.

plasma    cut    scabs    red   dissolved   germs   oxygen    platelets
w.s.9. **The blood system.**

The heart pumps the blood around the body. It travels inside tubes called blood vessels. Look at the diagram below and then try to complete the sentences at the bottom of this page.

![Blood System Diagram](diag.png)

**Exercise** - Complete the sentences below.

1) The blood travels around the body inside tubes called blood _____________.
2) The three types of blood vessel are arteries, ____________, and capillaries.
3) The heart is a ____________ that squeezes blood into the arteries.
4) The veins carry the blood back to the ____________.
5) The capillaries have very thin _____________.
6) The capillaries give useful chemicals to the body _____________.
7) The capillaries take ____________ chemicals away from the body cells.

vessels pump heart waste veins walls cells
In order to move the skeleton has JOINTS in between many of its parts. The movements are made by muscles which pull on the bones. Muscles CONTRACT (shorten) in order to pull. A muscle is made up of many thin fibres. Each fibre shortens when the muscle contracts.

A muscle cannot push, it can only pull. This is why a pair of muscles are needed at a joint. One muscle pulls the joint in one direction and the other pulls the joint back.

**Exercise** - Complete the sentences below.

1) A muscle is made up of many thin strands called .................
2) When a muscle contracts each fibre .................
3) Muscles are attached to bones by tough cords called .................
4) Muscles can only pull they cannot .................
5) Muscles work in ................. to move a joint in both directions.
6) If we wish to lift a weight our ................. contracts.
7) To lower the arm the biceps relaxes and the ................. contracts.
Puberty is the time when a child begins to change into an adult. In boys it begins between the ages of about 12-14 years. In girls it begins between the ages of about 11-13 years. Special chemicals called SEX HORMONES are released into the blood. These chemicals cause many of the changes that happen in the body. Emotional changes also happen at this time.

### Exercise 1 - Fill in the missing words in the passage below.

All ......................... eventually grow up to be men and women. The time when the body is changing is called ......................... Changes happen all over the ......................... Emotional changes also happen at puberty and we feel ......................... to the opposite sex. A ......................... called testosterone is made by the testes in a boy and this causes some of the ......................... in his body. In a girl the ovaries make a hormone called ......................... which causes many of the changes in her body.

### Exercise 2 - In the table below there is a list of changes which happen at puberty. Tick the right hand columns to show which changes happen to boys, girls or both.

<table>
<thead>
<tr>
<th>Changes at puberty</th>
<th>Boys</th>

</table>
W.S.12. **The human reproductive system.** Name ........................................

The diagrams below show the male and female reproductive systems.

**The male reproductive system**

- glands
- sperm duct
- epididymis
- scrotum
- testis
- penis
- urethra

**The female reproductive system**

- oviduct (fallopian tube)
- developing ovum
- uterus wall
- uterus (womb)
- vagina
- ovary
- funnel

**Exercise** - fill in the missing words in the passage below.

In the man the testes make the .......... cells. The sperms are stored in a coiled .......... called the epididymis. The ................. becomes erect during sexual intercourse. The sperms are carried through a long tube called the sperm .......... to the top of the penis. Here glands make fluids that help the sperms to .......... The urethra is a tube that carries sperms and .......... out of the body.

In the woman the ovaries make the .......... (egg cells). One ovum is produced every .......... The ovum is carried along the .......... (fallopian tubes) down to the uterus (womb). The placenta grows in the uterus wall during pregnancy. This gives the developing baby .......... and oxygen.

duct urine ova food sperm tube month swim oviducts penis
W.S.13. **The menstrual cycle.**

Once every month a woman’s body releases an ovum (egg cell) into the oviduct (fallopian tubes). Usually the ovum is not fertilised and it dies. The woman has her period when the lining of the uterus breaks down and blood and dead cells pass out through the vagina. The diagram below shows what happens during a woman’s monthly cycle.

---

2

During the week after ovulation the lining of the uterus becomes thicker as many blood capillaries grow in it. This prepares the uterus to feed the fertilised ovum.

1

During the first 2 weeks the ovum develops inside the ovary and the uterus lining repairs itself. On about day 14 OVULATION happens.

3

If the ovum is not fertilised the thick uterus lining breaks down about 14 days after ovulation. Blood and dead cells pass out through the vagina.

---

**Exercise** - Complete the sentences below.

1) Only one ovum is released every __ __ __ __

2) The release of an ovum from the ovary is called __ __ __ __ __ __ __

3) Ovulation happens after about ____ days.

4) The uterus lining __ __ __ __ the fertilised ovum.

5) If the ovum is not fertilised it will __ __

6) A woman has her period when the __ __ __ __ lining breaks down.
W.S.14. **Ovulation and fertilisation.**

Every month an ovum (egg cell) is released from an ovary into the oviduct. This is called **OVULATION.** If there are sperm cells in the oviduct the ovum may join with one of them. This is called **FERTILISATION.** The fertilised ovum then travels down to the uterus where it grows into a baby. The diagram below shows what happens to the ovum after it is released from the ovary if it is fertilised.

**Exercise** - Complete the sentences below.

1) **O** _ _ _ _ _ _ _ _ means when the ovum is released from the ovary.
2) The joining of the ovum and sperm is called **F** _ _ _ _ _ _ _ _ _ _ _ _
3) Fertilisation usually happens in the **O** _ _ _ _ _ _ _ _
4) After fertilisation the egg begins to **D** _ _ _ _ _ _
5) The egg develops into a ball of **C** _ _ _ _
6) The baby develops in the **U** _ _ _ _
W.S.15. **The developing baby.**

When the baby starts to grow inside the uterus it is called an EMBRYO. By the time it reaches 9 weeks old it looks like a tiny human being and it is then called a FOETUS. The PLACENTA is a special organ that develops in the wall of the uterus. It gives the baby food and oxygen. The placenta also removes waste chemicals such as carbon dioxide and urea from the baby. The baby is attached to the placenta by the UMBILICAL CORD. This contains blood vessels that carry chemicals to and from the baby. The diagram below shows how this happens.

Exercise – Complete the sentences below.

1) When the baby reaches 9 weeks old it is called a _ _ _ _ _ _

2) The baby is surrounded by a bag of fluid called the _ _ _ _ _ _

3) The amnion _ _ _ _ _ _ _ _ the baby if the mother is knocked.

4) The placenta gives the baby food and _ _ _ _ _ _

5) The placenta takes _ _ _ _ _ _ chemicals away from the baby.

6) The U _ _ _ _ _ _ _ _ _ C _ _ _ attaches the baby to the placenta.
W.S.16. **Breathing (1).**

Our lungs absorb oxygen from the air. They also excrete waste carbon dioxide gas when we breathe out. The diagram below shows the structure of the lungs.

---

**Exercise** - Fill in the missing words in the passage below.

The lungs absorb ................. gas and excrete waste carbon dioxide. The air is drawn in through the ................ (windpipe) which is kept open at all times by rings of a bony material called ......................... The trachea divides into the right and left .................... which branch out into narrower tubes called bronchioles. The bronchioles end in tiny air sacs called .................. The alveoli have very thin walls and are surrounded by ...................... Here oxygen is absorbed into the .................. and carbon dioxide passes into the alveoli.

**Blood capillary**  **A single alveolus**

(trachea  oxygen  capillaries  cartilage  bronchus  alveoli  blood)
The lungs are in the chest. They are separated from the lower part of the body by a sheet of muscle called the diaphragm. The diagrams below show how we inhale (breathe in) and exhale (breathe out).

**Inhaling (breathing in).**

- The diaphragm contracts and it pulls downwards.
- Air is drawn into the lungs.
- Increase in volume causes a decrease in pressure.
- Muscles between the ribs contract to pull the rib cage upwards and outwards.

**Exhaling (breathing out).**

- The diaphragm relaxes and it bulges upwards.
- Air is forced out of the lungs.
- Decrease in volume causes an increase in pressure.
- The muscles relax which causes the rib cage to fall.

**Exercise** - Complete the sentences below.

1) The diaphragm is a sheet of M_ _ _ _ _ _
2) The word I _ _ _ _ _ _ means to breathe in.
3) The word E _ _ _ _ _ _ means to breathe out.
4) The diaphragm and rib muscles both C _ _ _ _ _ _ _ _ during inhaling.
5) The V _ _ _ _ _ _ of the chest increases when we inhale.
6) Air is drawn into the lungs due to a D _ _ _ _ _ _ _ _ in pressure.
7) The diaphragm and rib muscles both R _ _ _ _ during exhaling.
8) Air is forced out of the lungs due to an I _ _ _ _ _ _ _ _ in pressure.
**W.S.18. Keeping the lungs clean.**

Your nose, trachea (wind pipe) and the air tubes inside the lungs are lined with special cleaning cells and a thick, sticky liquid called MUCUS. This traps dirt and germs in the air you breathe. The cleaning cells have tiny hairs called CILIA on their surface. These hairs waft the dirty mucus up to your throat where it is swallowed. Any germs are killed by the acid in the stomach. The diagram below shows how this cleaning system works.

The effects of smoking on the lungs.
Cigarette smoke stops the cilia beating and then dirty mucus builds up in the air tubes. This can lead to chest infections and people who smoke often develop a nasty cough. The air tubes can become swollen and sore. This is called BRONCHITIS. Cigarette smoke also contains a poisonous gas called carbon monoxide which stops the blood carrying as much oxygen around the body. Cigarette smoke also contains tar which collects in the lungs. Tar contains many chemicals that cause cancer.

**Exercise** - Complete the sentences below.

1) Dirt and germs in the air you breathe are trapped by M _ _ _ _

2) Ciliated cells have tiny H _ _ _ _ to waft up the dirty mucus.

3) Any germs that are swallowed are killed by the A _ _ _ _ in the stomach.

4) Cigarette smoke stops the cilia B _ _ _ _ _ _

5) A smoker may have less O _ _ _ _ _ in their blood.

6) Tar from cigarette smoke causes C _ _ _ _
We need energy for movement, warmth and to keep all of the body parts working. We get our energy by reacting glucose and oxygen together in our cells. This chemical reaction is called RESPIRATION and it can be shown with a word equation.

\[
\text{FOOD} + \text{OXYGEN} \rightarrow \text{ENERGY} + \text{WATER} + \text{CARBON DIOXIDE}
\]

Respiration is similar to burning food but it releases the energy much more slowly inside our cells.

**Exercise 1** - Complete the missing labels on the diagram below.

![Diagram of respiration process]

**Exercise 2** - Complete the sentences below.

1) Respiration produces useful _ _ _ _ _ _ in the cells.

2) We need energy to _ _ _ _ and to keep warm.

3) The main food substance that is used in respiration is _ _ _ _ _ _ _

4) _ _ _ _ _ _ _ is a similar process to respiration but it happens much more quickly.

5) The waste gas produced by respiration is C _ _ _ _ _ _ D _ _ _ _ _ _ _

6) We get rid of carbon dioxide by _ _ _ _ _ _ _ _ it out.

7) If plants did not make _ _ _ _ _ _ gas we would soon use it all up.
Drugs affect the way the body works. Some drugs are used by doctors to treat sick people. These can be very useful but they must be taken in the correct amounts. It is illegal (against the law) to take certain drugs because they are so dangerous to health. Even legal drugs such as alcohol can be very harmful if too much is taken. Some drugs are ADDICTIVE. This means that a person can become dependent on them and if they do not have the drug they may develop WITHDRAWAL SYMPTOMS such as shaking and sickness. The table below gives information about the effects of various drugs on health.

<table>
<thead>
<tr>
<th>Type of drug</th>
<th>How it affects the body</th>
</tr>
</thead>
<tbody>
<tr>
<td>Alcohol</td>
<td>Alcohol slows down the speed at which the brain and nervous system works. A little alcohol makes people feel happy and relaxed. More alcohol makes a person feel dizzy and affects their judgement. Large amounts may make a person unconscious and they may even die. An alcoholic is a person who is addicted to alcohol. Heavy drinking over several years causes damage to the brain, liver, and heart.</td>
</tr>
<tr>
<td>Tobacco</td>
<td>Tobacco smoke is very poisonous. A person can become addicted to smoking because of a chemical called nicotine in the smoke. Smoking causes cancers, heart disease, bronchitis, and damaged lungs. Smoking also makes a person short of breath and more tense.</td>
</tr>
<tr>
<td>Cannabis</td>
<td>Cannabis or 'pot' causes hallucinations. This is when a person thinks that they are seeing or hearing something that does not exist. They can then become confused and do dangerous things and may have a fatal accident.</td>
</tr>
<tr>
<td>Solvents</td>
<td>Some people like to breathe in the fumes from substances such as glue and paint (glue sniffing). This makes them feel dizzy and they may have hallucinations. The fumes get into the blood and damage the heart. Many people have died as a result of breathing in solvents.</td>
</tr>
</tbody>
</table>

Exercise - Fill in the missing words in the passage below.

An ......................... is a person who has become dependent on a certain drug. It is very dangerous to drink alcohol and then drive because the ......................... are slowed down. An ......................... is a person who is addicted to alcohol. They may damage their brain, ......................... and heart. People who smoke are usually more tense and ......................... as a result of the nicotine in their blood. The risk of developing ......................... cancer is much greater in smokers. Drugs such as cannabis make a person ......................... This can make them behave ......................... The fumes from ......................... may damage the heart and even cause death.

hallucinate addict reactions liver lung nervous dangerously solvents alcoholic
Germs are MICROBES that can live inside our bodies. The two main types of germ are BACTERIA and VIRUSES. Only some types of bacteria are germs. They cause us harm by attacking our cells or by producing waste poisonous chemicals. Viruses are much smaller than bacteria and they can only exist inside living cells. A virus injects its DNA (instructions) into a cell. The virus DNA tells the cell to make more viruses. The cell then bursts open to release the new viruses.

**A typical bacterium**

- Some have a slimy coating
- Simple nucleus
- Cell wall
- Cell membrane
- Cytoplasm
- Some have hairs for movement

**Types of bacteria**

- **COCCI** (round)
  - e.g. cause sore throat.
- **BACILLI** (rod)
  - e.g. cause typhoid.

**A typical virus**

- Outer coat
- DNA (instructions) is injected into the cell it is attacking.
- Feet attach to a cell

**Exercise** - Complete the sentences below.

1) Germs are microbes that live _ _ _ _ _ _ our bodies.
2) Bacteria and viruses are too _ _ _ _ _ _ to see.
3) Bacteria may cause disease by attacking body _ _ _ _ _ _
4) Bacteria may produce _ _ _ _ _ _ _ _ waste chemicals.
5) _ _ _ _ _ _ _ _ are much smaller than bacteria.
6) Viruses can only live and multiply inside _ _ _ _ _ _ cells.
7) A virus injects its _ _ _ into the cell it is attacking.
W.S.22. Fighting germs.

There are huge numbers of microbes in the air, soil and water. Some of these are germs. Therefore our bodies need a defence system. The skin helps to stop germs entering the body. The breathing system is lined with a sticky liquid called mucus which traps the dirt and germs that we breathe in. Tiny hairs called CILIA gradually waft the dirty mucus up to the throat where it is swallowed. The germs are then killed by hydrochloric acid in the stomach. Germs sometimes get into the bloodstream through wounds. If this happens white blood cells attack them. The diagrams below show how they do this.

**Phagocyte**

- Bacteria are taken in and digested.

**Lymphocyte**

- The lymphocyte sends out chemicals called ANTIBODIES to destroy bacteria.

---

**Exercise** - Complete the missing words in the passage below.

Most microbes are ......................... but some are germs that can live inside our bodies. The body needs to ......................... itself from invading germs. The ......................... forms a barrier that stops germs getting into the body. Any germs that are ......................... in are trapped by sticky mucus in the nose, ......................... and lungs. Eventually dirty mucus is ......................... and the hydrochloric acid inside the ......................... destroys the germs. The two types of white blood cell that kill germs are ......................... and lymphocytes. Phagocytes ......................... germs and lymphocytes make ...........................

A ......................... contains dead or harmless germs. It allows antibodies to build up in the body. ......................... are chemicals that can also be used to help us fight germs.

- **defend** phagocytes medicines harmless skin antibodies
- **eat** breathed trachea vaccine stomach swallowed
W.S.23. **Photosynthesis.**

Animals feed on plants or other animals but most plants make their own food by using light energy and simple chemicals. This process is called PHOTOSYNTHESIS. Water and carbon dioxide molecules are joined together to make GLUCOSE sugar and waste oxygen gas. This happens in the leaf cells inside tiny discs called CHLOROPLASTS. The chloroplasts contain a green chemical called CHLOROPHYLL which absorbs light energy. The diagram below shows this process.

![Diagram of photosynthesis]

The glucose sugar that is made may be changed into other useful chemicals for growth or storage. The plant also uses glucose as a fuel in RESPIRATION to release energy when it is needed in the cells. Respiration is the opposite process of photosynthesis:

\[ \text{FOOD} + \text{OXYGEN} \rightleftharpoons \text{CARBON DIOXIDE} + \text{WATER} + \text{ENERGY} \]

**Exercise** - Complete the sentences below.

1) Animals can not make their own F_ _ _ _
2) Plants use L_ _ _ _ energy to help them make their food.
3) Photosynthesis happens in the L_ _ _ _ cells.
4) The gas needed for photosynthesis is C_ _ _ _ D_ _ _ _ _ _
5) C_ _ _ _ _ _ _ _ _ _ is the green chemical that absorbs light energy.
6) The opposite reaction to photosynthesis is R_ _ _ _ _ _ _ _ _ _
7) Plants give animals food and O_ _ _ _ _ _
Plants make glucose sugar by the process of photosynthesis. For healthy growth they also need to absorb mineral salts that are dissolved in the soil water. Mineral salts contain elements such as nitrogen, phosphorus and magnesium. Water and mineral salts are absorbed from the soil by the ROOT HAIR CELLS which cover the surface of the root. These cells greatly increase the surface area for absorption.

**Element** | **Why it is needed**
--- | ---
Nitrogen | To make proteins for good growth.
Magnesium | To make the green chemical CHLOROPHYLL needed in photosynthesis.
Phosphorus | For good root growth.

**Exercise** - Complete the missing words in the passage below.

Certain chemical ....................... are needed for healthy growth in plants. They are obtained from mineral salts ....................... in the soil water. Root ....................... cells absorb water and mineral salts which are then carried up the ................ to the leaves. The root hair cells greatly ....................... the surface area of the root. If a plant does not have enough ....................... it cannot make chlorophyll and its leaves turn yellow. If a plant does not have enough ....................... it cannot make proteins and its growth is stunted. Phosphorus is needed for good ....................... growth.
All of the millions of species (types) of living things can be sorted into groups. This is called CLASSIFICATION. They are sorted into groups that have features in common.

**Plants without flowers.**

**FUNGI**
They do not contain the green chemical chlorophyll and so do not make their own food. Most feed on dead material and reproduce with tiny spores.

**ALGAE**
They live in water and have no roots or leaves. They make their own food and can be green, brown or red.

**MOSSES AND LIVERWORTS**
They have small, simple roots and leaves. They can only grow in damp places. They reproduce with spores.

**FERNS AND HORSETAILS**
They have well developed roots and stems. They usually grow in damp, shady places. They reproduce with spores.

**CONIFERS**
They are trees with tough, needle-shaped leaves. They do not have flowers and reproduce with cones.

Exercise - Fill in the missing words in the passage below.

Classification means sorting living things into ................. Living things can be sorted into groups that have .................... in common. Fungi are unusual plants because they do not contain green .................... Algae have no ................. or leaves. Fungi, mosses and ferns produce tiny .................... for reproduction and conifers produce ....................
W.S.26. **Flowering plants.**

Flowers contain sex organs which produce seeds for reproduction. The male sex cells are inside the pollen grains. The female sex cells are called **OVULES**. Pollen grains are carried from one flower to another by insects or wind. This is called **POLLINATION**. The sex cells then join together. This is called **FERTILISATION**. The fertilised ovules develop into seeds.

- **buttercup** - insect pollinated.
- **grass flowers** - wind pollinated.

The flowers are colourful and scented to attract insects.

The flowers are light and feathery to catch the breeze.

When the flower dies the seeds are left inside a **FRUIT**. Fruits help to **DISPERSE** (spread out) the seeds. Three types of fruit are shown below.

- Sycamore seeds have wings. They are dispersed by wind.
- Burdock seeds have hooks that catch onto animals’ fur.
- Blackberries are juicy but the seeds do not digest.

**Exercise** - Fill in the missing words in the passage below.

Flowers make ...................... so that plants can reproduce. Pollination is when ...................... is carried from one flower to another. Pollen can be carried by wind or ....................... The insects visit the flower to drink the ....................... Flowers are colourful and ...................... to attract insects. Plants that use wind to pollinate their flowers are not brightly ....................... They are light and feathery to catch the breeze.

Fertilisation is when the male and female sex cells ...................... The fertilised ...................... then develop into seeds. When the flower dies a ...................... is left behind. Fruits help to ...................... the seeds.

**insects** join pollen seeds ovules scented coloured nectar fruit disperse
W.S.27. **Animals without backbones (1).**  

All animals can be sorted into two main groups. VERTEBRATES have a backbone and INVERTEBRATES do not. Read the information below about the groups of invertebrates with soft bodies.

**JELLYFISH AND ANEMONES**  
They live in the sea. They have a very simple body with tentacles. Some have sting cells.

**FLATWORMS**  
They have a long, flat body. Some live in freshwater. Some are parasites that live inside other animals.

**SEGMENTED WORMS**  
They have a long body divided by rings into segments. Most of them live in water or soil.

**MOLLUSCS**  
They often have a shell for protection. Most of them live in water. Some have tentacles.

**STARFISH AND SEA URCHINS**  
They all live in the sea. They have a thick skin which is sometimes covered in spines.

**Exercise** - Complete the sentences below.

1) Animals with a backbone are called __________

2) Animals without a backbone are called __________

3) Jellyfish and sea anemones both have __________

4) A __________ is a flatworm that lives inside other animals.

5) An earthworm’s body is divided into __________

6) A __________ is a mollusc that has a shell for protection.

7) Sea urchins are covered in __________
ARTHROPODS are invertebrates with a hard outer coating. They all have a segmented body with jointed legs. This is a very large group and it can be divided into the smaller groups shown below.

**INSECTS**
They have three parts to the body and six legs. The adults usually have four wings and a pair of antennae.

**SPIDERS AND SCORPIONS**
They have two parts to the body and eight legs. Spiders usually spin a web of silk and have poisonous fangs. Scorpions have a sting at the end of their tails.

**CRUSTACEANS**
Most of them live in water. They usually have a thick, hard coating. They have many legs and two pairs of antennae.

**CENTIPEDES AND MILLIPEDES**
They have long bodies made up of many segments. Centipedes have one pair of legs on each segment and millipedes have two.

**Exercise** - Complete the sentences below.

1) _ _ _ _ _ _ _ _ _ _ all have a hard outer coating.
2) A fly is an _ _ _ _ _ _ _
3) Insects usually have _ _ _ legs and _ _ _ _ wings.
4) Spiders have _ _ _ _ _ _ legs.
5) Scorpions have a _ _ _ _ _ _ _ at the end of their tails.
6) Crabs and _ _ _ _ _ _ _ _ _ _ _ _ _ _ _ are closely related.
7) The bodies of centipedes are made up of many _ _ _ _ _ _ _ _ _
W.S.29. **Animals with backbones.**

VERTEBRATES have a backbone and an inside skeleton. Read the information below about the groups of vertebrates.

**FISH**
They live in water and have gills for breathing. They are covered with scales and have fins for swimming.

**AMPHIBIANS**
The tadpole (young) lives in water and has gills for breathing. The adult lives on land and has lungs. They have a damp skin without scales.

**REPTILES**
They have a dry, scaly, waterproof skin. Their eggs have a tough leathery shell and are laid on land.

**BIRDS**
They are covered with feathers and have wings for flying. Their eggs have a hard shell. They have a beak for feeding. Their bodies are warm because they make heat inside.

**MAMMALS**
They have hair and a warm body. The young develop inside the mother’s body. After they are born the young feed on milk from the mother’s body. Humans belong to this group.

**Exercise** - Fill in the missing words in the passage below.

Fish live in water and have ................. for breathing. Both fish and .................... have a scaly skin. The young of ......................... live in water but the adults live on land. Amphibians have a ............... skin. Both reptiles and ................... lay eggs on land. Birds are covered with ...................... and have ................... for flying. Birds and ....................... have a warm body. Mammals have .................. and feed their young on ..................

amphibians gills reptiles birds hair milk wings damp feathers mammals
All animals and plants are different from each other. Even members of the same species (type) show small differences and no two humans are exactly alike. This is called VARIATION. Some features that vary which are easy to study in humans are height, mass, hair colour, eye colour and shoe size. CONTINUOUS VARIATION is when a feature shows many different types eg. height. DISCONTINUOUS VARIATION is when a feature only shows a few different types eg. human blood groups and whether a person can roll their tongue or not.

Variation is caused partly by different GENES (instructions) that individuals inherit from their parents and partly by different ENVIRONMENTS (surroundings) that individuals live in:

**Genetic (inherited)**

- The chromosomes hold the GENES that control a person’s features and how they develop. All sperms and ova contain a different set of genes therefore every person receives a different combination from their parents.

**Environment (surroundings)**

- FOOD SUPPLY affects the growth rate of young animals. Two identical twins have the same genes but one may be heavier than the other due to eating more food. Plants also grow better in soil that has a good water and mineral supply.
- CLIMATE affects how animals and plants develop. Some animals grow a thicker coat if their environment becomes colder. Plants usually grow faster in the sun than they do in the shade. A person’s skin may become darker (tanned) if they are exposed to more sunlight.

**Exercise** - Complete the sentences below.

1) We are all different from each other. This is called V__________

2) The two types of variation are C__________ and discontinuous.

3) An example of continuous variation in humans is H________

4) We are all different, partly because of the G______ we inherited from our parents and partly because of our E__________

5) Every sperm and O______ contains a different set of genes.

6) Food supply affects the G______ rate of young animals.

7) Plants will grow larger in soil that is rich in M______
W.S.31. **Selective breeding.**

Humans have changed wild plants and animals by **SELECTIVE BREEDING**. This means picking out plants or animals that show the features that humans like. These are then bred together so that they pass on their features to the next generation. After many generations the plant or animal may look quite different to its wild ancestor. Dogs, cats, pigeons, rabbits, goldfish, farm animals and crops have all been produced in this way. Dog breeds have been developed from a wild wolf-like ancestor.

Scientists think that in nature all plants and animals have slowly changed over millions of years. This is called **EVOLUTION**. Those that are the best adapted to their environments (surroundings) have a better chance of surviving and passing on their features. Therefore nature is selecting which ones survive and breed. This idea is called **NATURAL SELECTION**.

**Exercise** - Complete the sentences below.

1) Humans have **C______** animals and plants by selective breeding.

2) Only those that show the best **F______** are allowed to breed.

3) Racing pigeons have been developed by selecting the **F______** birds.

4) Wolfhounds have been developed by selecting the **T______** dogs.

5) **E______** means how plants and animals have slowly changed.

6) Natural **S______** causes evolution.
The place where a plant or animal lives is called its HABITAT. All species have special features called ADAPTATIONS which help them to survive in their habitats. For example, a polar bear has a thick coat of fur to protect it from the cold and a camel can store large amounts of water in its stomach. The table below shows some of the ENVIRONMENTAL CONDITIONS that are important for survival.

<table>
<thead>
<tr>
<th>Environmental condition</th>
<th>Why it is important for survival</th>
</tr>
</thead>
<tbody>
<tr>
<td>Temperature</td>
<td>This affects the chemical reactions inside the cells of living organisms. When it is cold, organisms slow down.</td>
</tr>
<tr>
<td>Light</td>
<td>Plants need light to make food by photosynthesis. Animals need the food that plants make.</td>
</tr>
<tr>
<td>Water</td>
<td>Water is needed to dissolve chemicals for transport and so that chemical reactions can take place.</td>
</tr>
<tr>

Exercise 1 – Join up the organisms below to their correct habitats.

shark  buttercup  newt  monkey  fox

meadow  ocean  woodland  pond  jungle

Exercise 2 – Complete the sentences below.

1) A __________ is the place where an organism lives.
2) An __________ is a special feature that helps an organism to survive.
3) An adaptation of a cactus is a thick ______________ outer covering.
4) An organism’s surroundings are called its ______________
5) __________ is needed for chemical reactions to take place inside cells.

environment  adaptation  water  habitat  waterproof
W.S.33. **Changing habitats.**

The conditions in a habitat are always changing from day to night and from one season to the next. Light and temperature increase after sunrise and usually reach a peak at midday. In dry deserts the days are very hot but the nights are cold. Lizards and snakes need to absorb heat from their surroundings to keep their bodies working quickly.

Early morning the lizard basks in the sun to warm its body so that it can move more quickly. Later in the morning the lizard is very active and hunts for food. At midday the temperature in the desert is too high and the lizard hides in the shade.

The lizard’s behaviour is an adaptation to help it to survive. Many desert animals are NOCTURNAL (only active at night) when it is cooler.

The British winter is very cold and there is little food. Many animals grow a thicker fur coat to reduce heat loss. Some animals HIBERNATE. This is like a deep sleep. The body temperature falls and the heart and breathing almost stop. The body needs less energy and the animal can use its stored fat reserves over the winter.

Many birds MIGRATE during the winter months. This means that they fly to warmer countries where they can find enough food.

**Exercise 1** - Write down the correct words beside their meanings.

<table>
<thead>
<tr>
<th>Word</th>
<th>Meaning</th>
</tr>

<td>Fly to a warmer country.</td>
</tr>
</tbody>
</table>

**Exercise 2** - Complete the missing words in the passage below.

The conditions in a habitat are always C __ __ __ __ __ from day to night. In a desert it may be very hot during the day and C __ __ at night. Many desert animals are N __ __ __ __ __ __ The British winter is very cold and there is not much F __ __ for animals. Some animals adapt to cold winters by growing a T __ __ __ __ fur coat. Most animals store F __ __ under the skin during autumn. Animals hibernate to save E __ __ __ __
Green plants make food by PHOTOSYNTHESIS. Animals must feed on plants or other animals. The food is passed along a FOOD CHAIN.

![Food chain diagram]

Food chains always begin with plants. Animals that eat plants are called HERBIVORES. Animals that eat other animals are called CARNIVORES. Carnivores are also called PREDATORS and the animals that they hunt are called the PREY. In most habitats there are more plants than herbivores and more herbivores than carnivores. This can be shown with a PYRAMID OF NUMBERS.

![Pyramid of numbers diagram]

Pyramids of numbers are usually large at the bottom and small at the top. Sometimes they have a different shape because of the different sizes of the organisms in them. Two examples of this are shown below.

**Exercise** - Fill in the missing words in the passage below.

In habitats there is a mixture of ................. herbivores and carnivores. Carnivores are animals that eat other ................. Herbivores eat plants and are ................. by carnivores. Another name for carnivores is ................. and the animals that they hunt are called the ................. The amount of plants in a habitat must be ................. than the amount of herbivores or else the herbivores would run out of ................. In the same way there must be ................. carnivores than herbivores.

predators animals food fewer eaten plants prey greater
Exercise - Complete the food chains and sentences below.

PONDWEED → .................................. → WATER BEETLE → LARGE FISH
LEAF → WATER LOUSE → .................................. → GREBE

1) The predators of small fish are ____________ and ____________
2) The prey of water beetles are ______________
3) The prey of grebes are ________________ and ________________
4) The animal that only eats dead tree leaves is the ________________
5) The 3 herbivores are ___________ ___________ and ___________
6) The 2 top predators are the ___________ and ___________
Farmers often spray their crops with PESTICIDES to kill pests such as insects and weeds. Pesticides may stay in the environment (surroundings) a long time and poison animals higher up the food chains. Pesticides can also be washed into streams and ponds. The diagram below shows how pesticides can build up along food chains.

If the pesticide is passed on from the caterpillars into small birds and then into the hawk we can see how it would quickly build up in the hawk’s body. Scientists are now trying to make pesticides that only affect the pest and break down a short time after they have been used. They are also trying to find other ways of controlling pests by using their natural enemies. This is called BIOLOGICAL CONTROL.

Exercise - Complete the sentences below.

1) P _ _ _ _ _ _ _ _ _ are poisons that kill pests.
2) Pesticides can get into food C _ _ _ _ _ and poison other animals.
3) Small B _ _ _ _ eat many insects which may have pesticides in them.
4) Hawks may be P _ _ _ _ _ _ _ by eating birds that contain pesticides.
5) Pesticides can also be washed into S _ _ _ _ _ _ _ and P _ _ _ _
6) B _ _ _ _ _ _ _ _ _ _ control means using a pest’s natural enemy to destroy it.
A population is a number of organisms of the same species (type) living in one place. For example there may be a population of one thousand tadpoles living in a pond, or a population of five hundred oak trees in a wood. The graph below shows how a population of rabbits grew when scientists placed one hundred of them onto an island where rabbits had never lived before.

The population grew slowly at first as the rabbits were getting used to their new habitat. The population then grew very quickly as the rabbits had plenty of food and space and they were reproducing. The growth rate of the population then slowed down until it reached a fairly steady level of about 260 rabbits. At this point competition between the rabbits for food and space had increased and predators were finding and killing the rabbits more easily. When the balance between the number of births and deaths becomes equal the population stops growing.

**Exercise** - Complete the missing words in the passage below.

A ................. is a number of organisms of the same species living in one place. There are a number of factors that control how big a population of animals can ................. Competition for ................. and space is important. As the population grows there will be ..................... competition and so more animals will ................. Predators are also important in controlling the numbers of ................. animals. If the number of predators increases more prey will be ..................... If the number of predators decreases more prey will ..................... In the same way, the ................. of a predator's population is controlled by the numbers of its prey. If there are more prey there will be more predators. A population stays steady when the number of births equals the number of .................
Everything is made up of particles that are too small to see. The three states of matter are SOLID, LIQUID and GAS. They all have different properties due to the arrangement and movement of their particles.

Solids.
The particles are held tightly together by strong forces. They make small vibrations but they stay in place. This gives solids a definite shape and volume. Solids are DENSE (heavy) and they can not be compressed (squashed) easily because the particles are already packed closely together.

Liquids.
A liquid can flow because the particles can move past each other. The particles are still held closely together by strong forces. Liquids are DENSE and they can not be compressed easily. A liquid can change its shape but not its volume.

Gases.
There are only very weak forces between the particles which are far apart. The particles move around very quickly and bounce off each other. Gases have a low density (they are very light) and they do not have a definite shape or volume.

Exercise - Complete the spaces in the table below.

<table>

W.S.39. **Changes of state.**

When a solid is heated it changes into a liquid state and then a gas state. When a gas is cooled it changes back into a liquid and then into a solid. The diagrams below show this using water as an example.

**Solid - ice.**
The particles are held firmly in place but they vibrate.

**Liquid - water.**
The particles gain more energy. The vibrations become stronger until they break apart.

**Gas - steam.**
The particles have gained enough energy to break free. They are moving very quickly.

**Gas pressure and diffusion.**
If a gas is squeezed into a small space e.g. when air is pumped into a balloon, the particles bump against the walls. This causes a PRESSURE.

A gas will DIFFUSE (spread out) until it fills up any area that it is contained in. The gas particles diffuse until they are EVENLY SPREAD OUT.

**Exercise** – Join up the words in the left-hand column with their meanings in the right-hand column.

<table>
<thead>

An element is a pure substance that cannot be broken down into anything simpler. Everything on Earth is made from about one hundred different elements. An ATOM is the smallest particle of an element. They are much too small to be seen even with the most powerful microscope. Each element contains only one type of atom. Atoms have a NUCLEUS in the centre with ELECTRONS moving around it.

**Exercise** - Complete the missing words in the sentences below.

1) An _ _ _ _ _ _ _ cannot be broken down into anything simpler.

2) The smallest particle of an element is called an _ _ _ _ \_ \_ \_ \_ \_ \_.

3) The _ _ _ _ _ _ _ is in the centre of an atom.

4) Electrons have a _ _ _ _ _ _ _ _ charge.

5) Protons have a _ _ _ _ _ _ _ _ charge.

6) The atomic number is the number of _ _ _ _ _ _ _ _ in an atom.
Exercise - Complete the missing words in the passage below.

Each group in the periodic table contains elements that have similar .................... The atomic number gives the number of ..................... that an element contains. The lightest element is ..................... (H) which has an atomic number of one. The atomic number of ..................... is eight. Sodium (Na) and potassium (K) are two very ..................... metals. Iron (Fe) and nickel (Ni) are two of the ..................... metals. The most reactive non-metals are called the ..................... The ..................... gases are very unreactive. Magnesium (Mg) and calcium (Ca) are both in group ..................... of the periodic table. Nitrogen (N) and phosphorus (P) are both in group ..................... of the periodic table.

magnetic noble two hydrogen reactive five halogens properties oxygen protons
Elements join together by chemical reactions to form compounds. Compounds have different properties to the elements that formed them. In a chemical reaction new substances are formed and energy is taken in or given out. It is also difficult to make a reaction go backwards.

**Exercise 1** - Fill in the missing words or symbols for the chemical reactions below.

**Coal burning**

\[
\text{CARBON} + \text{OXYGEN} \iff \text{CARBON DIOXIDE} + \text{HEAT}
\]

\[
\ldots \ldots \ + \ \text{O}_2 \iff \text{CO}_2 \ + \ \text{HEAT}
\]

**Hydrogen exploding**

\[
\text{HYDROGEN} + \ldots \ldots \ldots \ldots \iff \text{WATER} + \text{HEAT}
\]

\[
2\text{H}_2 + \text{O}_2 \iff 2\text{H}_2\text{O} + \text{HEAT}
\]

**Making salt**

\[
\text{SODIUM} + \text{CHLORINE} \iff \text{SODIUM CHLORIDE (salt)}
\]

\[
\text{Na} + \text{Cl} \iff \ldots \ldots \ldots \ldots
\]

**Exercise 2** - For each of the changes below write down if it is a physical or chemical change.

When a firework explodes it is a ______________ change.

When salt dissolves in water it is a ______________ change.

When a cake is baked in an oven it is a ______________ change.

When ice melts it is a ______________ change.
**W.S.43. Separating mixtures.**

A mixture contains a number of substances that are not chemically joined. The diagrams below show different ways of separating mixtures. Fill in the missing words in the paragraphs beside each method.

**Chromatography.**
In the diagram the colours in pen ink are being separated. As water rises up the .................. it takes the colours with it. Different colours travel at different .................. If the ink contains more than one colour they will separate out along the paper.

**Filtration.**
This method separates small, solid particles from liquids. In the diagram a mixture of sand and water is being filtered. The .................. passes through the filter paper and the .................. is held back. The sand particles are too big to pass through the pores in the ..................

**Distillation.**
This method separates dissolved chemicals (SOLUTES) from the liquids that they are dissolved in (SOLVENTS). In the diagram salt solution is being separated into salt and .................. The water evaporates from the boiling solution and then condenses as it is .................. in the condenser. The salt is left behind in the ..................

**Exercise 2** - Join up each mixture below with the correct method for separating it.

- muddy water.................. distillation
- copper sulphate solution.................. filtration
- peas and sand.................. magnetic attraction
- iron filings and sawdust.................. sieving
W.S.44. **Metals and non-metals.**

The elements can be divided into two main groups which are METALS and NON-METALS. The table below shows the properties of each group.

<table>
<thead>
<tr>
<th>Metals</th>
<th>Non-metals</th>
</tr>
</thead>
<tbody>
<tr>
<td>Most are shiny solids at room temperature although mercury is a liquid. They usually have high melting points.</td>
<td>They vary in their properties. They usually have low melting points and many are gases at room temperature.</td>
</tr>
<tr>
<td>Good conductors of heat.</td>
<td>Most are poor conductors of heat.</td>
</tr>
<tr>
<td>Good conductors of electricity.</td>
<td>Poor conductors of electricity except for graphite which is a form of carbon.</td>
</tr>
<tr>
<td>A few are magnetic (iron, cobalt and nickel).</td>
<td>None are magnetic.</td>
</tr>
<tr>
<td>They are often flexible (bendy) and can be hammered into shape.</td>
<td>They are often brittle (hard but break easily).</td>
</tr>
</tbody>
</table>

**Exercise 1** - For each diagram below write down if the element is a metal or a non-metal.

- Iron is a __________
- Bromine is a __________
- Copper is a __________
- Sulphur is a __________

**Exercise 2** - Complete the sentences below.

1) **M_____** is the only metal that is a liquid at room temperature.
2) **G_____** is the only non-metal that is a good conductor of electricity.
3) The **M_____** metals are iron, cobalt and nickel.
4) **M_____** can be hammered into shape.
W.S.45. **Changes of state.**

The three states of matter are SOLID, LIQUID and GAS. One state can change into another. The diagram below shows this.

![Diagram of states of matter: Solid to Liquid to Gas and vice versa, with Heat and it MELTS, Heat and it EVAPORATES, Cool and it FREEZES, Cool and it CONDENSES.]

When a solid changes to a liquid, or a liquid changes to a gas, heat is absorbed. This is because the particles that make up the substance need more energy to move faster and overcome the forces that hold them together. When a gas changes to a liquid, or a liquid changes to a solid, heat is given out. This is because the particles lose energy as they slow down. The substance still keeps the SAME MASS because it still contains the SAME NUMBER OF PARTICLES.

**Exercise** - Use the information in the table below to help you complete the sentences at the bottom of this page.

<table>
<thead>
<tr>
<th>Substance</th>
<th>Melting point (°C)</th>
<th>Boiling point (°C)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Oxygen</td>
<td>-219</td>
<td>-183</td>
</tr>
<tr>
<td>Ethanol</td>
<td>-15</td>
<td>78</td>
</tr>
<tr>
<td>Water</td>
<td>0</td>
<td>100</td>
</tr>
<tr>
<td>Sulphur</td>
<td>119</td>
<td>445</td>
</tr>
<tr>
<td>Iron</td>
<td>1,540</td>
<td>2,900</td>
</tr>
</tbody>
</table>

1) Oxygen is a _ _ _ at room temperature.

2) Water and _ _ _ _ _ _ _ are liquids at room temperature.

3) _ _ _ _ _ _ _ and iron are solids at room temperature.

4) Sulphur melts at a temperature of _______ °C

5) Iron melts at a temperature of _______ °C

6) The substance with the lowest melting point in the table is _ _ _ _ _ _ _

7) Ethanol has a _ _ _ _ _ boiling point than water.
Exercise 1 - Fill in the missing words in the passage below.

If a solid ....................... in water we say that it is SOLUBLE. The substance that dissolves is called the SOLUTE and the liquid that it dissolves in is called the SOLVENT. Water is a good .................. because many substances will dissolve in it. If you have been using .................. paint you can not wash your brush in .................. because the paint will not dissolve. The correct solvent for gloss paint is white ..................

spirit solvent dissolves gloss water

Exercise 2 - Complete the sentences below.

1) If you keep adding sugar to cold water you reach a point where no more sugar will _ _ _ _ _ _ _ _

2) A solution that cannot dissolve any more solute is fully _ _ _ _ _ _ _ _

3) Solids are _ _ _ _ soluble in water as the temperature rises.
W.S.47. **Expansion.**

If a metal bar is heated up it EXPANDS (gets bigger) slightly. This happens because the metal particles gain more energy and vibrate more.

Most materials expand slightly when they are heated.

**Problems caused by expansion.**

In hot weather a bridge could expand and buckle.

Overhead wires shorten in cold weather and could snap.

**Uses of expansion.**

As the mercury warms up it expands and moves up the thermometer scale.

Rivets hold metal plates tightly together.

**Exercise** - Fill in the missing words in the passage below.

Most materials .................... when they are heated and .................... when
they are cooled. This is because their particles .................... more when
hot and so move further .................... In hot weather a metal bridge could
expand and .................... To stop this from happening it is held on rollers.
Overhead wires could contract and .................... in cold weather. To stop
this from happening they are given slack when they are put up. Mercury
is a liquid metal that is used inside a .................... When it is put in a
warmer place the mercury expands and moves up the ....................

vibrate apart snap thermometer contract buckle expand scale
Rocks can be slowly broken up by the weather. This is called WEATHERING. The diagrams below show how this can happen.

**Rocks and weathering.**

1. The slow wearing away of rocks is called _WEATHERING_.
2. _Rainwater_ can make limestone rocks slowly dissolve away.
3. In deserts rocks can be weathered by _sand_ carried in the wind.
4. Expansion and _contraction_ can cause rocks to crumble.
5. When water freezes it _freezes_ This can break rocks apart.

**Exercise** - Complete the sentences below.

1) The slow wearing away of rocks is called _WEATHERING_.
2) _Rainwater_ can make limestone rocks slowly dissolve away.
3) In deserts rocks can be weathered by _sand_ carried in the wind.
4) Expansion and _contraction_ can cause rocks to crumble.
5) When water freezes it _freezes_ This can break rocks apart.
W.S.49. The rock cycle.

Over millions of years rocks slowly change from one type into another. This is called the ROCK CYCLE. The diagram below shows how it happens.

Exercise - Fill in the missing words in the passage below.

Weathering of rocks causes small particles called ....................... to form. The sediments are ......................... by rivers to seas. Over many years ........................ of sediments build up on the sea bed. The sediments are squashed together so that they form ..................... rocks. Sandstone and .................. are two examples of sedimentary rocks. Heat and pressure deep inside the Earth may change sedimentary rock into ........................ rock. Rocks inside the Earth may melt to form ............... Sometimes magma returns to the surface during volcanic ....................... It then cools down to form solid ......................... rock.

mudstone magma igneous sediments metamorphic transported eruptions layers sedimentary
W.S.50. Types of rock.

Rocks can be divided into three main types depending on how they were formed. Read the information below about the three types of rock.

**Igneous rocks.**
These are formed when molten magma cools down and becomes solid. They are made of tiny crystals. If the magma cools quickly on the surface of the Earth then the crystals are small. If the magma cools slowly, deeper in the Earth's crust, then the crystals are larger. Igneous rocks are very hard.

**Sedimentary rocks.**
These are made from layers of SEDIMENT (small particles) on the bottom of rivers or seas. The sediments are compressed as more layers build up on top of them. The particles then become cemented together to form solid rocks. The layers of rock are called STRATA. Sedimentary rocks have a grainy structure and they easily crumble.

**Metamorphic (changed) rocks.**
These are formed from igneous or sedimentary rocks which are changed by heat or pressure deep underground. They are usually harder than the rocks that formed them.

**Exercise** - Complete the sentences below.
1) Igneous rocks form when M _ _ _ _ cools down.
2) Granite contains L _ _ _ _ crystals because the magma cooled slowly.
3) Sedimentary rocks are made from particles called S _ _ _ _ _ _ _ _ _ _
4) Layers of rock are called S _ _ _ _ _ _
5) Sedimentary rocks easily C _ _ _ _ _ _
6) Metamorphic rocks have been changed by H _ _ _ or pressure.
7) Heat and pressure changes limestone into M _ _ _ _ _ _
All of the different materials around us have been formed by chemical reactions from about one hundred simple elements. The diagram below shows a chemical reaction between the elements iron and sulphur.

This reaction can be shown as a word equation:

\[
\text{IRON} + \text{SULPHUR} \rightarrow \text{IRON SULPHIDE}
\]

The new substance formed is a compound called iron sulphide. It has different properties to the iron and sulphur that it is made from.

**Exercise 1** - fill in the missing words in the sentences below.

1. The mass of the reactants (starting chemicals) is **E** _ _ _ _ to the mass of the products (the chemicals that are made).
2. The products have different **P** _ _ _ _ _ _ _ _ _ _ to the reactants.
3. During a chemical reaction **H** _ _ _ is either taken in or given out.
4. A chemical change is difficult to **R** _ _ _ _ _ _ (go backwards).

**Exercise 2** - Join up each word in the left hand column with its meaning on the right.

<table>
<thead>
<tr>
<th>ELEMENTS</th>
<th>The chemicals that are made.</th>
</tr>
</thead>
<tbody>
<tr>
<td>PRODUCTS</td>
<td>The simplest substances.</td>
</tr>
<tr>
<td>COMPOUND</td>
<td>Starting chemicals.</td>
</tr>
<tr>
<td>REACTANTS</td>
<td>Elements joined together.</td>
</tr>
</tbody>
</table>
W.S.52. **Types of chemical reaction.**

There are several different types of chemical reaction.

**Synthesis**
Two or more substances join together to make a single new substance. For example when iron and sulphur are heated together:

\[
\text{IRON} + \text{SULPHUR} \xrightarrow{\text{heat}} \text{IRON SULPHIDE}
\]

**Decomposition**
A substance breaks down into simpler substances. For example, if calcium carbonate (limestone) is heated to a very high temperature:

\[
\text{CALCIUM CARBONATE} \xrightarrow{\text{heat}} \text{CALCIUM OXIDE} + \text{CARBON DIOXIDE}
\]

**Oxidation**
A substance gains oxygen during a chemical reaction. The substance that gains the oxygen is OXIDISED. For example, if copper is heated in air:

\[
\text{COPPER} + \text{OXYGEN} \xrightarrow{\text{heat}} \text{COPPER OXIDE}
\]

**Exercise 1** - Complete the sentences below.

1) Synthesis means when substances _ _ _ _ together.
2) Decomposition means when a substance _ _ _ _ _ _ _ _ down.
3) Oxidation is when a substance gains _ _ _ _ _ _ _ _ in a chemical reaction.

**Exercise 2** - For each diagram below write down the type of chemical reaction it shows.

1) Burning sodium metal in chlorine gas to form sodium chloride (salt). This type of reaction is:

2) Heating white lead nitrate crystals to produce a yellow powder and a brown gas. This type of reaction is:

3) If an iron nail is exposed to air it forms orange iron oxide (rust). This type of reaction is:
Burning is a type of oxidation reaction. It happens when a substance reacts with oxygen in the air to produce heat and light. The substance that burns is oxidised during the reaction. For example when carbon in the form of coke is burnt:

\[
\text{CARBON} + \text{OXYGEN} \rightarrow \text{CARBON DIOXIDE} + \text{heat and light.}
\]

FUELS can be burnt to release useful energy. They burn more strongly in pure oxygen. If a smouldering wooden splint is placed into a jar that contains oxygen it will relight. This is a test for oxygen gas.

The fire triangle.
The fire triangle shows the three things that are needed for burning to happen. Removing any of them stops a fire.

Exercise - Complete the sentences below.

1) Burning is a chemical reaction between fuel and O _ _ _ _ _

2) When carbon burns C _ _ _ _ _ D _ _ _ _ _ _ gas is produced.

3) Burning can be useful because it releases E _ _ _ _ _

4) The test for oxygen is a smouldering S _ _ _ _ _

5) The three things needed for a fire are oxygen, F _ _ _ and heat.

6) A fire blanket is used to stop A _ _ getting to a fire.

7) Pouring water onto a fire takes away the H _ _ _
Most of the materials that we use every day have been made by chemical reactions. Some of the most common products are made from two important raw materials, METAL ORES and CRUDE OIL.

**Metal ores.**
Most metals exist as compounds called ORES inside rocks. Ores must be reacted with other chemicals to extract the metals that they contain. The more reactive the metal is, the more difficult it is to release from its ore. If a metal is less reactive than carbon it can be extracted by heating its ore with coke in a furnace. For example HAEMATITE (iron ore) contains iron oxide:

\[
\text{IRON OXIDE} + \text{CARBON} \rightarrow \text{IRON}
\]

**Crude oil.**
Natural oil from the ground is called CRUDE OIL. It contains a mixture of substances that can be changed into many useful products.

**Exercise** - Complete the sentences below.

1) Many useful materials are made by chemical R _ _ _ _ _ _ _

2) An ore contains a M _ _ _ _ _ joined to other elements.

3) If a metal is less reactive than C _ _ _ _ _ it can be extracted using coke in a furnace.

4) Crude oil is a M _ _ _ _ _ _ of useful substances.

5) N _ _ _ _ is a synthetic fibre.
Some chemical reactions are harmful because they destroy our products.

**Corrosion of metals.**
Metals may be attacked by air, water or other substances around them. Usually the more reactive the metal is, the faster it corrodes. The corrosion of iron and steel is called RUSTING. The experiment below shows that both air and water are needed for rusting to happen.

In dry air the iron nail does not rust. In water without air the iron nail does not rust. In air and water the iron nail rusts.

To stop rusting metals can be coated with a substance that keeps out air and water. Paint, grease, plastic, or a thin layer of tin or zinc can be used.

**Oxidation of foods.**
Some foods react with oxygen gas in the air. This makes them taste unpleasant. Fat can be oxidised quickly, therefore fatty foods such as butter should be kept in a fridge to slow down the rate of oxidation. Another way of stopping oxidation is to keep air away from the food by using sealed packets or tins.

**Exercise** - Fill in the missing words in the passage below.

The corrosion of iron and steel is called ...................... Iron will only rust if it is exposed to both air and ...................... We can stop rusting by ...................... the metal with a substance that keeps out ...................... and water. This is why motor cars are given several layers of ...................... Some foods are ...................... when exposed to air. This gives them an unpleasant ...................... Keeping foods ...................... will slow down the rate of oxidation. Another way of stopping ...................... is to make sure that the food does not come into contact with air.

air rusting taste cool water oxidation coating oxidised paint
W.S.56. **Energy from chemical reactions.** Name ........................................

Heat may be taken in or given out during a reaction. Sound, light, movement or electrical energy may also be produced. When fuels are burnt they give out heat and light energy. Explosive fuels give out movement and sound energy as well. The chemical reaction that takes place inside a torch battery gives out electrical energy.

**Energy from fuels.**

Wood can be burnt as a fuel. Fossil fuels form over millions of years.

Burning of fuels makes carbon dioxide, water and heat energy:

\[
\text{FUEL} + \text{OXYGEN} \rightarrow \text{CARBON DIOXIDE} + \text{WATER} + \text{ENERGY}
\]

The heat energy can be used to keep our houses warm and to cook food. It can also be changed into movement energy to drive engines.

**Effects on the environment.**

Burning fuels release carbon dioxide into the air. This stops heat escaping from the surface of the Earth back into space. This is called the GREENHOUSE EFFECT and it may lead to GLOBAL WARMING.

Oil and coal release sulphur dioxide gas when they burn. This gas goes into the air and dissolves in rain droplets to form ACID RAIN. In some parts of Europe acid rain has destroyed plant and animal life in lakes and forests. Acid rain also causes corrosion of buildings and statues.

**Exercise** - Complete the sentences below.

1) Different types of E _ _ _ _ _ can be produced by chemical reactions.

2) When fuels are burnt they give out heat and L _ _ _ _ _ energy.

3) The reaction inside a battery produces E _ _ _ _ _ _ _ _ _ _ energy.

4) Extra carbon dioxide gas in the air may lead to G _ _ _ _ _ warming.

5) Burning of oil and C _ _ _ releases sulphur dioxide gas.

6) Sulphur dioxide gas forms A _ _ _ rain.
W.S.57. Reactivity of metals.

We can arrange the metals in order of most to least reactive. The three tests below are used to judge how reactive different metals are:

<table>
<thead>
<tr>
<th>Metal</th>
<th>Reaction with oxygen</th>
<th>Reaction with water</th>
<th>Reaction with acid</th>
</tr>
</thead>
<tbody>
<tr>
<td>Potassium</td>
<td>Burns strongly with a lilac flame.</td>
<td>Very fierce and ignites (catches fire).</td>
<td>Too dangerous to perform.</td>
</tr>
<tr>
<td>Sodium</td>
<td>Burns strongly with a yellow flame.</td>
<td>Fierce but it does not ignite.</td>
<td>Too dangerous to perform.</td>
</tr>
<tr>
<td>Magnesium</td>
<td>Burns with a blinding white flame.</td>
<td>Very slow reaction but it reacts with steam.</td>
<td>Very fast reaction that produces hydrogen gas.</td>
</tr>
<tr>
<td>Zinc</td>
<td>Burns slowly with a dull red flame.</td>
<td>Reacts slowly with steam.</td>
<td>Quite a slow reaction. Some hydrogen produced.</td>
</tr>
<tr>
<td>Iron</td>
<td>Does not burn but it glows brightly.</td>
<td>Very slow reaction with steam.</td>
<td>Very slow reaction.</td>
</tr>
<tr>
<td>Lead</td>
<td>Melts but does not burn.</td>
<td>No reaction.</td>
<td>Extremely slow.</td>
</tr>
<tr>
<td>Copper</td>
<td>Does not burn but it forms a black coating.</td>
<td>No reaction.</td>
<td>No reaction.</td>
</tr>
<tr>
<td>Gold</td>
<td>No reaction.</td>
<td>No reaction.</td>
<td>No reaction.</td>
</tr>
</tbody>
</table>

Exercise - Complete the sentences below.

1) _ _ _ _ _ _ _ _ _ is the most reactive metal.

2) _ _ _ _ is the least reactive metal.

3) Potassium and sodium are too reactive to add to _ _ _ _

4) You should not look at _ _ _ _ _ _ _ _ _ when it burns in oxygen.

5) _ _ _ _ does not corrode because it is an unreactive metal.

6) Metals react faster with _ _ _ _ _ than they do with water.
W.S.58. **Displacement reactions.**

If two metals are put together the more reactive metal will ‘win’ any competition to form a compound. The experiment below shows a reaction between an iron nail and copper sulphate solution.

![Diagram of iron nail and copper sulphate solution](image)

A coating of copper forms over the nail.

Iron and copper compete to be the compound in the solution. Iron is more reactive and so it DISPLACES (pushes out) the copper in the solution.

$$\text{IRON} + \text{COPPER SULPHATE} \rightarrow \text{IRON SULPHATE} + \text{COPPER}$$

A metal will always displace a less reactive metal from solutions of its compounds.

**Exercise 1** – Study the experiment below and then try to complete the missing words.

![Diagram of silver nitrate and copper coin solution](image)

A metal will always displace a less reactive metal from solutions of its compounds.

Copper is __ less reactive than silver so it displaces silver in the solution.

**Displacement reactions with metal oxides.**

Two metals can also compete for oxygen. For example, if magnesium powder is heated with copper oxide there is an explosive reaction:

$$\text{MAGNESIUM} + \text{COPPER OXIDE} \rightarrow \text{MAGNESIUM OXIDE} + \text{COPPER}$$

**Exercise 2** – Complete the missing words in the sentences below.

Magnesium ‘wins’ the competition for __ because it is higher in the reactivity series than __. When a metal is heated with the oxide of a __ reactive metal it will remove the oxygen from it.
**W.S.59. Acids and alkalis.**

Name ………………………………………

Acids are CORROSIVE (eat into materials). They react with some metals to form hydrogen gas and a salt. Acids have a sour taste, and many are poisonous. A purple dye called LITMUS changes to a red colour in acids.

Alkalis are the chemical opposites of acids, but some of them are also very corrosive. They dissolve in water and often have a soapy feel. Alkalis turn litmus blue and they can be used to NEUTRALISE (cancel out) acids. A NEUTRAL solution is neither acid or alkali.

### Acids

<table>
<thead>
<tr>
<th>STRONG</th>
<th>WEAK</th>
</tr>
</thead>
<tbody>
<tr>
<td>These are the poisonous mineral acids:</td>
<td>ethanoic acid in vinegar</td>
</tr>
<tr>
<td>hydrochloric acid</td>
<td>citric acid in fruit juices</td>
</tr>
<tr>
<td>sulphuric acid</td>
<td>carbonic acid in soda water</td>
</tr>
</tbody>
</table>

### Alkalis

<table>
<thead>
<tr>
<th>STRONG</th>
<th>WEAK</th>

#### STRONG ACIDS

#### WEAK ACIDS

#### WEAK ALKALIS

#### STRONG ALKALIS

Acids becoming stronger

Alkalis becoming stronger

Exercise – Complete the sentences below.

1) If a chemical is _ _ _ _ _ _ _ _ _ it will eat into materials.

2) Acids react with some _ _ _ _ _ _ _ to produce hydrogen gas.

3) Litmus turns _ _ _ in acid and _ _ _ _ in alkali.

4) The pH is a measure of how _ _ _ _ _ _ _ _ _ _ _ _ _ _ the acid or alkali is.

5) A chemical with a pH number of six is a _ _ _ _ acid.
W.S.60. **Acids and metals.**

Metals that are more reactive than copper will react with acids to form hydrogen gas and a salt.

\[
\text{ACID} + \text{METAL} \rightarrow \text{HYDROGEN} + \text{SALT}
\]

The more reactive the metal is, the faster the reaction will be. The experiment below shows the reaction between hydrochloric acid and magnesium.

1) The magnesium reacts with the acid.
2) A solution of magnesium chloride has formed.
3) Magnesium chloride salt is left behind.

**Exercise** - Complete the missing words in the sentences and equations below.

1) A metal must be more reactive than C _ _ _ _ _ _ to react with an acid.
2) ACID + METAL \[\rightarrow\] HYDROGEN + __________
3) Reactive metals produce hydrogen F _ _ _ _ _ _ than unreactive metals.
4) The test for H _ _ _ _ _ _ is a lighted splint.
5) Hydrogen is an E _ _ _ _ _ _ _ _ gas.
6) hydrochloric acid + magnesium \[\rightarrow\] __________ + magnesium chloride
7) All of the A _ _ _ _ has reacted when there are no more hydrogen bubbles given off.
8) The S _ _ _ _ that has been made is magnesium chloride.
W.S.61. **Acids and bases.**

Bases can neutralise (cancel out) acids. Bases that dissolve in water are called alkalis. A base reacts with an acid to form a salt and water:

\[
\text{ACID} + \text{BASE} \rightarrow \text{SALT} + \text{WATER}
\]

For example, if sodium hydroxide, which is a very strong alkali, is reacted with hydrochloric acid then sodium chloride (common salt) is formed.

**Reaction with carbonates.**
Carbonates are bases that contain the elements carbon and oxygen. They react with acids to form a salt, carbon dioxide gas and water. The reaction is fizzy due to the carbon dioxide gas given off:

\[
\text{ACID} + \text{CARBONATE} \rightarrow \text{SALT} + \text{CARBON DIOXIDE} + \text{WATER}
\]

The experiment below shows the reaction between calcium carbonate (marble chips) and hydrochloric acid.

\[
\text{calcium carbonate} + \text{hydrochloric acid} \rightarrow \text{calcium chloride} + \text{carbon dioxide} + \text{water}
\]

**Exercise** - Complete the missing words in the sentences and equations below.

1) A **B _ _ _ ** is a chemical that can neutralise an acid.

2) Bases that dissolve in water are called **A _ _ _ _ _ _ **

3) **ACID + BASE** \( \rightarrow \) **________ + WATER**

4) Sodium **C _ _ _ _ _ _ ** is common salt.

5) Carbonates contain the elements carbon and **O _ _ _ _ **

6) Carbonates react with acids to produce **C _ _ _ _ _ _ D _ _ _ _ _ _ **

7) Marble chips will **F _ _ _ ** in acid until it has all been neutralised.
W.S.62. **Neutralisation.**

Sometimes we need to NEUTRALISE (cancel out) acids or alkalis. Acids and alkalis can be used to neutralise each other. The diagrams below show some examples of this.

**Acid indigestion**

Stomach contains hydrochloric acid. Too much acid causes indigestion.

Indigestion tablets contain a weak alkali to neutralise the acid.

**Insect stings**

WASP STING - alkaline so treat it with a weak acid such as vinegar.

BEE STING - acidic so treat it with a weak alkali such as sodium bicarbonate.

**Acid soils and lakes**

Acid rain falling onto soils and lakes can make them too acidic.

Blocks of limestone are added to neutralise acid.

**Exercise** - Fill in the missing words in the passage below.

The stomach contains ......................... acid. If there is too much acid in the stomach it causes ..................... Tablets can be taken that contain a weak ................ to neutralise the acid. A bee sting is ................... and must be treated with a weak alkali such as sodium ....................... A wasp sting is alkaline and must be treated with a weak acid such as .................

Soils and lakes can become too acidic in areas that are polluted with acid ............... Blocks of ......................... can be added to lakes to neutralise the acid and ....................... limestone can be spread onto fields.

powdered vinegar hydrochloric acidic limestone rain alkali bicarbonate indigestion
W.S.63. **Acid rain.**

Oil and coal release sulphur dioxide gas when they burn. This gas goes into the air and dissolves in rain droplets to form **ACID RAIN.** In some parts of Europe acid rain has destroyed plant and animal life in lakes and forests. Acid rain also causes corrosion of metal and stonework.

---

**Exercise** - Use the diagrams above to help you complete the sentences below.

1) The main waste gas that causes acid rain is **S** _ _ _ _ _ _ _ dioxide.

2) Sulphur dioxide is given off from burning oil and **C** _ _ _ _ _ _ _

3) Power stations burn fossil fuels to make **E** _ _ _ _ _ _ _ _ _ _ _ _ _

4) Sulphur dioxide gas mixes with **R** _ _ _ _ _ _ _ _ _ _ _ _ _ _ _ _ in the atmosphere.

5) If a lake becomes too acidic the fish and other water life will **D** _ _ _ _ 

6) Acid rain washes **M** _ _ _ _ _ _ _ _ out of the soil.

7) Acid rain corrodes **M** _ _ _ _ _ _ and stonework.
W.S.64. Electric current and voltage.

Metals are good CONDUCTORS (carriers) of electricity. Most non-metals do not conduct electricity and we call them INSULATORS. An electric current will only flow through a COMPLETE circuit. A chemical reaction inside the battery pushes the current from the negative terminal to the positive terminal.

The diagram opposite shows what happens if two batteries are put into the circuit. Carefully compare it to the first diagram at the top of this page and then try to complete the missing words in the passage below.

A battery pushes out the C _ _ _ _ _ The voltage across both batteries can be measured using a V _ _ _ _ _ _ _ With two batteries there is T _ _ _ _ as much voltage. This produces twice the current and so the bulb is much B _ _ _ _ _ _ _ The negative end of one battery must be connected to the P _ _ _ _ _ end of the other battery. If they are connected the wrong way round the current will not F _ _ _

The bulb is much brighter.
W.S.65. **Series and parallel circuits.**

Name ...........................................

**Exercise 1**
The diagrams below show the two ways of adding two bulbs to a circuit. Study them carefully and then try to fill in the missing words in the passages underneath. Choose from the list of words at the bottom.

- Bulbs in series
- Bulbs in parallel
- switch
- CLOSED
- 3 amps
- 6 amps
- The bulbs are dim.
- The bulbs are much brighter.

The current is ................. because it is harder for it to travel through both bulbs. We say that there is a high ......................... The current does not get used up as it travels around the circuit. The ......................... gives the same reading anywhere in the circuit.

Both bulbs are connected directly across the two batteries therefore they are given the full ......................... The current is ................. because it is easier for it to flow around the circuit. If another bulb was connected in parallel they would still be as .........................

- voltage
- small
- bright
- resistance
- larger
- ammeter

**Exercise 2** - Study the two circuit diagrams below and then try to complete the sentences.

1) If the switch is opened in circuit 1 both bulbs would ______________
2) If bulb A is removed from circuit 1 bulb B would get ______________
3) If switch 1 is opened in circuit 2 only bulb ____ would light up.
W.S.66. **Electrical resistance.**

When a bulb is connected into an electrical circuit, the current passes from the thick copper connecting wires, into the thin filament wire of the bulb. The filament does not let the current pass through as easily. It has a bigger RESISTANCE than the connecting wires. This causes the filament to heat up and electrical energy is changed into heat and light energy.

**Using resistors.**
The resistance of a wire increases if it is made thinner or longer. RESISTORS are lengths of wire that are used in circuits to reduce the current. They are used in electrical devices such as radios and televisions to keep the currents at the correct levels. A VARIABLE RESISTOR is a long coil of nichrome resistance wire. It has a sliding contact that can be moved along the coil to change the resistance. The bulb in the circuit diagram opposite can be gradually made dimmer or brighter by sliding the control on the resistor.

**Short circuits.**
An electric current always takes the easiest route around a circuit. In the diagram opposite the bulb does not light up because it is easier for the current to pass through the copper wire than through the bulb. The bulb has a bigger resistance than the wire. This is called a SHORT CIRCUIT.

**Exercise** - Complete the missing words in the passage below.

The thin wire inside a light bulb is called a F_______. This does not let the C______ pass through it easily because it has a high electrical R_____. When a bulb lights, electrical energy is being changed into H______ and light energy. C______ is a metal with a very low resistance which is why it is used for electric wires. The thinner a wire is the M______ resistance it has. Resistors are used in electrical devices to stop currents getting too H_____. A variable resistor is used to change the S______ of the current in a circuit. They are used as dimmer switches in household L______. Variable resistors are also used as V______ controls in televisions and radios.
W.S.67. **Magnets.**

The magnetic metals are iron, steel, cobalt and nickel. They are attracted to magnets and can become magnetized themselves. There are invisible magnetic forces around a magnet. This is called a MAGNETIC FIELD. The forces are strongest around the ends, which are called the NORTH (N) POLE and the SOUTH (S) POLE.

The field lines can be shown by placing a piece of paper over the magnet and then sprinkling iron filings on top. The iron filings follow the pattern of the field lines. A compass always points from north to south along the field lines.

**Forces between magnets.**

If the poles of two bar magnets are brought close together they will exert a force on each other. They will either ATTRACT (pull together) or REPEL (push away from each other). This depends on what type of poles are brought together:

<table>
<thead>
<tr>
<th>N</th>
<th>S</th>
<th>N</th>
<th>S</th>
<th>N</th>
<th>S</th>
</tr>
</thead>
<tbody>
<tr>
<td>REPEL</td>
<td>ATTRACT</td>
<td>REPEL</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The rule is: **LIKE POLES REPEL AND UNLIKE POLES ATTRACT.**

**Exercise 1** - Underneath each diagram write down whether the magnets will attract or repel.

1) ....................  
2) ....................  
3) ....................

**Exercise 2**

The diagrams below show three steel pins. Two of them are magnetized (have become magnets) and one is not. Try to work out which of the pins are magnets.

Therefore the magnetic pins are _________
**W.S.68. Electromagnets.**

When a wire carries an electric current it produces a weak magnetic field around it. The field can be made **stronger** by increasing the **current** passing through the wire.

The magnetic field can also be made **stronger** by winding the wire into a **coil** called a **Solenoid**. The magnetic field that is produced is like the one around a bar magnet. The greater the **number of turns** on the coil the **stronger** the magnetic field becomes.

If an **iron bar** is placed inside the solenoid the magnetic field becomes **much stronger**. This is called an **Electromagnet** and it can be used in many devices, e.g. electric bells. The diagram below shows how an electromagnet is made.

When the current is switched off the iron bar loses its magnetism. If a **steel** bar is put into the solenoid it stays a permanent magnet after the current is switched off.

**Exercise** - Complete the sentences below.

1) If a wire carries an electric current it produces a magnetic __________

2) If the current is increased the magnetic field gets __________

3) A coil of wire is called a __________

4) The __________ turns of wire on the coil the stronger the magnetic field.

5) An iron bar inside a solenoid makes an ______________
W.S.69. Uses of electromagnets.

The diagrams below show how electromagnets are used in various devices. Try to complete the missing words in the passages underneath each one.

**An electric bell.**
When the push switch is closed the current flows through the __ __ __. The electromagnet then attracts the iron __ __ __. The hammer moves and strikes the __ __ __. As this happens the contacts separate and the circuit is broken. The electromagnet is switched __ __ and the hammer springs back.

**Sorting scrap metal.**
In a scrap yard electromagnets can be used to separate iron and __ __ __ objects from other materials. A thick __ __ __ supplies electricity to the magnet. The electricity is switched on to pick the metals up and then switched __ __ to put them down.

**Electromagnetic switches – RELAYS.**
Sometimes it is dangerous to switch on a circuit directly. For example, a car starting motor needs a current of over 100 amps. An electromagnetic switch called a __ __ __ can be used to switch the circuit on safely. When the switch in the __ __ __ circuit is closed the magnet is switched on. This pulls the iron __ __ __ towards it and the __ __ __ are closed. The motor in the __ __ __ circuit is now switched on.
The SPEED of a moving object is the DISTANCE it travels divided by the TIME that it takes.

\[ \text{SPEED} = \frac{\text{DISTANCE}}{\text{TIME}} \text{ or } \frac{\text{DISTANCE}}{\text{TIME}} \]

**Units for speed**
- metres per second (m/s)
- miles per hour (mph)
- kilometres per hour (km/h)

The example below shows how to work out the speed of a toy car.

![Diagram of toy car with speeds and times](image)

The average speed of the car: \[ \frac{\text{distance}}{\text{time}} = \frac{10\text{m}}{5\text{s}} = 2\text{m/s} \]

**Exercise 1** - Work out the answers to the problems below. REMEMBER UNITS.

1) A sprinter runs 100m in 10 s. His average speed = \[ \frac{100\text{m}}{10\text{s}} = \] _____ m/s

2) A train travels 600km in 5 hours. Its average speed = \( \frac{600\text{km}}{5\text{h}} = \) _____

3) A boy cycles 20 miles in 2 hours. His average speed = _____ = _____ mph

**Working out distance and time.**
You can use the formula triangle on the right to work out speed, distance or time. For example, if you wish to work out distance then place your finger over the distance part (D) and you will see that distance is speed \( \times \) time (S \( \times \) T).

**Exercise 2** - Use the formula triangle to help you work out the problems below.

1) A car travels at 40 mph. What distance will it travel in 3 hours?

\[ \text{distance} = _______ \times _______ = 40 \text{ mph} \times 3 \text{ hours} = _______ \]

2) An athlete sprints at 10m/s. How long does it take him to complete a 200m race?

\[ \text{time} = \frac{\text{DISTANCE}}{\text{SPEED}} = _______ = _______ \]
A FORCE is a PUSH or PULL. Force is measured in NEWTONS (N). Forces can speed up or slow down objects. The diagrams below show how different forces can affect the movement of a car.

1. Force from the engine makes the car begin to move.  
2. As the car speeds up the force of air resistance gets bigger.  
3. The car reaches a steady speed when the two forces are equal.

When the force pushing against the car is the same size as the force from the engine the car stops accelerating and travels at a steady speed.

Forces can also make objects change direction. The diagram below shows this.

1. Shuttlecock moving in one direction hits the racket with a force.  
2. The racket gives a force to the shuttlecock and causes it to change direction.

The important rules from this are:

1. Unbalanced forces change the speed and/or direction of moving objects.  
2. Balanced forces produce no change in the movement of an object.

**Exercise** - Complete the sentences underneath each of the diagrams below.

1) The car will _________________  
2) The car will _________________  
3) The car will _________________  
4) The book will not _________________
Friction is a force that stops two surfaces sliding past each other. It is caused by tiny bumps on the surfaces which catch together.

**Uses of friction.**

1. Friction gives grip for shoes and tyres. We could not move over the ground without friction.
2. Brakes on bicycles and cars use friction to slow down the wheels.
3. Air resistance is a type of friction that slows down parachutes.

**Problems caused by friction.**

1. Friction slows down moving machinery. It can also make machinery over heat. Grease and oil must be used to reduce friction.
2. Air resistance is a type of friction that slows down vehicles. The faster the vehicle travels the greater the air resistance becomes. Car bodies are designed so that the air slips smoothly over the bonnet.

Exercise - Complete the missing words in the passage below.

The force that stops two surfaces sliding past each other is called ________________. If there was no friction between our shoes and the ground our feet would ______________ when we tried to walk. Rubber brake blocks grip against the ________________ of a bicycle wheel in order to slow it down. A parachute reaches a steady speed when the force of ________________ pulling it down is balanced by the air resistance pushing ________________. Friction between the moving parts of machinery can cause it to over ________________. The friction can be ________________ by using oil or ________________. The ________________ a car moves the greater the air resistance is that pushes against it.

slip reduced friction faster heat rims gravity grease upwards
W.S.73. **Turning forces.**

Forces can cause objects to turn around a pivot.

The important rule from this is:

*The size of the turning force can be increased by increasing the length of the lever.*

**Some examples of how we use turning forces.**

- Using a spanner to loosen a nut.
- Using a crowbar to force objects apart.
- Using a wheelbarrow to carry heavy loads.

**Exercise** - Complete the sentences below.

1) A _ _ _ _ _ _ is a turning point.

2) A long _ _ _ _ _ _ makes it easy to move a heavy object.

3) The longer the lever the greater the _ _ _ _ _ _ _ _ _ _ _ _

4) A _ _ _ _ _ _ _ _ _ _ can be used to lever open a locked door.

5) A tight nut can be loosened easily if a _ _ _ _ spanner is used.
Pressure is the amount of force that is put onto a certain area.

\[
\text{PRESSURE (N/m}^2\text{)} = \frac{\text{FORCE (N)}}{\text{AREA (m}^2\text{)}}
\]

Another unit for pressure is the pascal (Pa)

\[1 \text{ N/m}^2 = 1 \text{ Pa}\]

Small pressure.
A force is spread over a large area.

**Snow shoes**
These spread a person's weight over a large area which prevents them from sinking into soft snow.

**Washers**
A washer spreads the force from the nut which stops it being pulled into wood.

Large pressure.
A force is concentrated over a small area.

**Knife edge** - large pressure to cut into materials.

**Stiletto heel**
When all of the woman's weight is resting on the heel it produces a very large pressure. This can cause damage to floors with soft surfaces.

**Working out force and area.**
You can use the formula triangle on the right to work out pressure, force and area. For example, if you wish to work out force then place your finger over the force part (F) and you will see that force is pressure × area (P × A).

**Exercise** - Work out the answers to the questions below.

1) A man weighs 800N. The area of BOTH of his boots is 0.08m\(^2\). What pressure does he place on the ground when he stands still?

\[
\text{PRESSURE (N/m}^2\text{)} = \frac{\text{FORCE (N)}}{\text{AREA (m}^2\text{)}} = \frac{800\text{N}}{0.08\text{m}^2} = \text{___________ N/m}^2
\]

2) A woman weighs 500N. The area of ONE of her stiletto heels is 0.0002m\(^2\). What pressure does she place on the ground when she puts her weight onto one heel?

\[
\text{PRESSURE (N/m}^2\text{)} = \frac{\text{FORCE (N)}}{\text{AREA (m}^2\text{)}} = \frac{500\text{N}}{0.0002\text{m}^2} = \text{___________ N/m}^2
\]

3) The base of a suitcase has an area of 0.2m\(^2\). It places a pressure of 700N/m\(^2\) on the ground. What must the weight of the suitcase be?

\[
\text{force is pressure } \times \text{ area (P } \times \text{ A)} = 700\text{N/m}^2 \times \text{________ m}^2 = \text{_______ N}
\]
W.S.75. Reflection.

We can see objects because light travels from them into our eyes. LUMINOUS objects make their own light, e.g. the Sun, a light bulb and a candle. Most objects do not make their own light. We see them because light bounces off them into our eyes. This is called REFLECTION.

![Diagram of light rays from a bulb]

1. Light rays travel away from the bulb in all directions.
2. A ray reflects off the book.
3. The ray enters the eye and the person sees the book.

Mirrors.

Mirrors have a very smooth, shiny surface. All of the light rays bounce off them at the same angle. This is what makes a clear REFLECTION.

![Diagram of light rays hitting a mirror]

Light rays hitting a mirror are all reflected at the same angle due to its smooth surface.

The rays that hit the mirror are called the INCIDENT RAYS. The diagram above shows that the REFLECTED RAYS leave the surface of the mirror at the same angle that they came in at.

Exercise - Complete the questions below.

1) A L_ _ _ _ _ _ _ object gives off its own light.
2) Underline the objects below that give off their own light.
   TORCH BOOK CANDLE MIRROR GLOW WORM MOON SUN COIN FIREWORK
3) We can see our R_ _ _ _ _ _ _ _ _ in shiny, smooth surfaces.
4) Complete the diagrams below.
W.S.76. Refraction of light.

Any material that light can travel through is called a MEDIUM. When light rays travel from one medium to another they bend. This is called REFRACTION. The diagram shows how a ray of light bends as it travels from air, into a glass block, and out again.

How refraction happens.
The light bends because it travels more slowly in glass than it does in air. This can be compared to a car that travels more quickly on a road than it does on sand:

Exercise - Complete the sentences and diagram below.

1) Any material that light can travel through is called a M _ _ _ _ _ 
2) The bending of light is called R _ _ _ _ _ _ _ _ _ _ 
3) Light travels more _ _ _ _ _ _ _ _ _ _ _ _ in glass than it does in air.
4) Light bends as it passes from air to glass because it changes _ _ _ _ _ _

Complete the diagram below to show why the coin appears higher in the water than it really is.
A PRISM is a triangular glass block. If a beam of white light is passed through a prism it is REFRACTED (bent). The light is also split up into seven different colours called a SPECTRUM.

This spreading out of colours is called DISPERSION. It also happens when light hits rain drops which is how rainbows form. An easy way to remember the order that the colours appear in is to remember this rhyme:

Richard Of York Gave Battle In Vain.

The effect of coloured filters on white light.
A FILTER only allows one colour of light to pass through it. The filter ABSORBS the other colours so they do not pass through.

Exercise - Complete the sentences and diagram below.

1) The range of colours in white light is called the S _ _ _ _ _ _ _

2) The spreading out of the seven colours is called D _ _ _ _ _ _ _ _

3) The colour that is bent the least by a prism is _ _ _

4) The colour that is bent the most by a prism is _ _ _ _ _ _

Complete the diagram below to show what would happen to the light as it meets the two filters.
W.S.78. Coloured objects in coloured lights. Name……………………………………

A white object reflects all seven colours of the spectrum. A red object looks red because it only allows red light to reflect off it. The rest of the colours of the spectrum are absorbed by the object.

White light contains seven colours.

Green book

Only red light is reflected into the eye.

Only green light is reflected into the eye.

RED BOOK

GREEN BOOK

In red light the red book still looks red because it reflects the red light. If the book is placed in any other colour of light it will absorb the light. No light is reflected off the book into the eye so it looks black.

The book still looks red.

The book looks black.

The important rule from this is:

Coloured objects only reflect their own colour light.

Exercise – For the items of clothing in the table below write down the colours that they would look in the different lights shown. Some have been done for you.

<table>
<thead>
<tr>
<th>Item of clothing</th>

W.S.79. **Hearing.**

We hear things when SOUND WAVES pass into our ears. The diagram below shows the parts of the human ear and how we hear.

**Hearing ranges.**
The range of pitches that a person can hear is called their HEARING RANGE. Different people have different hearing ranges. Young people can hear higher pitched sounds than older people. Young people can also hear quieter sounds.

**Hearing damage.**
The sense cells in the cochlea are very delicate. If a person is exposed to very loud noises over a long time the sense cells can become damaged and the person can become partially deaf. This is why people who work in very noisy places must wear ear protection. This is also the reason why it is dangerous to listen to personal stereos at too high a volume.

**Exercise** - Join up the parts of the ear with their correct descriptions below.

<table>
<thead>
<tr>
<th>Part of ear</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ear drum</td>
<td>a tube that carries sound waves to the ear drum</td>
</tr>
<tr>
<td>ear canal</td>
<td>a tight sheet of skin that vibrates when sound waves hit it</td>
</tr>
<tr>
<td>auditory nerve</td>
<td>sends nerve messages to the brain</td>
</tr>
<tr>
<td>ear bones</td>
<td>contains the sense cells that detect vibrations</td>
</tr>
<tr>
<td>cochlea</td>
<td>pass the vibrations from the ear drum to the cochlea</td>
</tr>
</tbody>
</table>
Sound waves. Sound waves are made by vibrating objects. The diagram shows a tuning fork. The ends of the fork are vibrating (moving backwards and forwards) very quickly. This makes sound waves.

Loudness and pitch. The diagram shows the shape of sound waves on an oscilloscope screen. The bigger the AMPLITUDE (height of the waves) the louder the sound. The greater the FREQUENCY (number of waves per second) the higher the PITCH. A short wavelength gives a high frequency.

Exercise 1 - Complete the sentences below.
1) Sounds are made by V _ _ _ _ _ _ _ _ objects.
2) Sound travels as W _ _ _ _
3) The A _ _ _ _ _ _ _ _ means the height of a sound wave.
4) The F _ _ _ _ _ _ _ _ means the number of waves in one second.
5) The greater the frequency the H _ _ _ _ _ the pitch.
6) The longer the wavelength the L _ _ _ _ the frequency.

Exercise 2 - Match the diagrams to their correct descriptions below.

A   B   C   D

HIGH PITCH AND QUIET = ___  HIGH PITCH AND LOUD = ___
LOW PITCH AND QUIET = ___  LOW PITCH AND LOUD = ___
W.S.81. **Comparing Light and Sound.**

In air light travels at a speed of 300,000,000 metres per second. Sound travels much more slowly at a speed of about 330 metres per second. This is why we see an exploding firework before we hear it.

Light can only travel through **TRANSPARENT** materials such as water and glass. Sound must have a **MEDIUM** (substance) to travel through because something is needed to pass on the vibrations. Sound travels better through solids than it does through air.

**Sound in a vacuum.**

Sound can travel through solids, liquids and gases. The diagram shows a bell jar that contains an electronic buzzer. As the air is pumped out of the jar the sound of the buzzer becomes quieter. When there is no air left inside the jar (a vacuum) the buzzer cannot be heard because there is nothing to carry the vibrations. **SOUND CANNOT TRAVEL THROUGH A VACUUM.**

**Exercise** – Complete the sentences below.

1) The speed of light is much **faster** than the speed of sound.
2) Light can only travel through **transparent** materials.
3) You **see** a firework before you **hear** it.
4) Sound needs a **medium** to travel through.
5) **Sound** cannot travel through a vacuum.
6) **Light** can travel through a vacuum.

see light transparent hear sound faster medium
W.S.82. **Day and night.**

The Earth spins around an imaginary line called its AXIS. The axis runs from the North to the South pole. The Earth turns once every twenty four hours (one day). During the day we face towards the Sun and at night we face away from the Sun.

![Diagram of Earth's rotation and axis]

**Sunrise and sunset.**

The Sun and other stars APPEAR to slowly move across the sky because the Earth is turning. The sun rises in the EAST and sets in the WEST.

![Diagram showing sunrise and sunset]

**Exercise** - Complete the sentences below.

1) The imaginary line that the Earth spins around is called its ______
2) It takes one ______ for the Earth to turn once.
3) During the day we face ______ ______ the Sun.
4) The Sun rises in the ______ ______ and sets in the ______
5) Our shadows are longest in the ______ and in the evening.
6) At ______ ______ the Sun is at its highest in the sky.
It takes 365 days and 6 hours for the Earth to complete one orbit of the Sun. We make one year 365 days but every four years we need to add on an extra day to make up for the six extra hours. This is why a LEAP year has 366 days. During a year in Britain the weather gradually changes from warm Summer to cold Winter and back again. The different SEASONS are caused by the tilt of the Earth on its axis. The diagram below shows how this happens.

**Exercise** – Study the diagram above and then try to complete the sentences below.

1) One complete circle around the Sun is called an __________

2) It takes one __________ for the Earth to orbit the Sun.

3) In __________ the Sun is at its highest in the sky.

4) In __________ the Sun is at its lowest in the sky.

5) In Summer the Northern Hemisphere is tilted __________ the Sun.

6) Australia is in the __________ Hemisphere so in December it is their __________
The Sun and other stars are sources of light. Planets orbit stars and do not make their own light. We can sometimes see the moon and some of the planets at night because they REFLECT light from the Sun. The SOLAR SYSTEM is our Sun together with the nine planets that orbit it. The order of the nine planets starting with the one closest to the Sun is:

Mercury  Venus  Earth  Mars  Jupiter  Saturn  Uranus  Neptune  Pluto

An easy way to remember the order of the planets is to remember this rhyme:

My Very Easy Method Just Speeds Up Naming Planets.

The diagram below gives an idea of how far the planets are from the Sun.

The diagram below shows how the planets compare in size. The length of each planet’s year (orbit time) is also given underneath each one (d = days, y = years.)

Exercise - Complete the sentences below.

1) The planet that is closest to Earth is _ _ _ _ _

2) The largest planet is _ _ _ _ _ _ _ _

3) The further the planet is from the Sun the _ _ _ _ _ is its year.

4) The planet with a year about twice as long as Earth’s is _ _ _ _

5) Planets that are close to the Sun have very _ _ _ _ temperatures.

6) The rings around _ _ _ _ _ _ _ are easily seen.
The planets are attracted towards the sun by an invisible force called GRAVITY. This is what keeps the planets in orbit. In the same way the Moon orbits the Earth because of the pull of gravity between them. Any object that travels around a planet in this way is called a SATELLITE. Humans have sent artificial satellites into space. These are very useful in several ways.

**The Moon is our natural satellite.**

The Moon travels anticlockwise around the Earth. It takes 27.3 days to complete one orbit. During this time the Moon changes from a full moon to nothing and then back to a full moon again. This happens because we only see the part of the Moon which reflects light from the Sun. The part that is in shadow does not show up. We see different amounts of the lit side as the Moon travels around the Earth. Early people used this cycle to keep track of the months.

**Artificial satellites.**

Artificial satellites have the following uses:

1. To observe and photograph the Earth.
2. To study weather systems.
3. To send radio and TV signals around the world.
4. To look deeper into Space. In Space there is no atmosphere (air) to cloud our view. The Hubble telescope is a satellite that has helped us to discover more about the Universe.

**Exercise** - Fill in the missing words in the passage below.

The Moon orbits the Earth because of the pull of ................... Any object that orbits the Earth is called a ...................... The ................... is the Earth’s natural satellite. It takes about twenty seven days for the Moon to complete one ................... During this time the Moon appears to change shape from a ................... moon to nothing and then back again.

If a satellite is given too much .................... it will escape into Space. If it has too little speed the force of gravity will pull it back down to .................... The Hubble .................... is a satellite that helps us to see much more clearly into Space. It can do this because in Space there is no .................... to block our view.

Earth full air speed telescope gravity Moon satellite orbit
**W.S.86. The Moon and its phases.**

The Moon appears to change shape as it travels around the Earth. This happens because we only see the part of the Moon that reflects light from the Sun. The diagram below shows how this happens.

The changing appearance of the Moon is called its **PHASES**. The complete cycle from one new Moon to the next takes 29.5 days even though it only takes the Moon 27.3 days to completely orbit the Earth. The difference between these two times is because the Earth also slowly changes position as it orbits the Sun.

**Gravity on the Moon.**

The Moon has a much smaller mass than the Earth. This makes its pull of gravity six times smaller than the Earth’s. This means that if you weigh 600N on Earth you would only weigh 100N on the Moon. This is why an astronaut feels very light on the Moon and can jump six times higher than they can on Earth. The bigger the mass of a planet the bigger its force of gravity.

**Exercise** - Complete the sentences below.

1) The changing appearance of the Moon is called its __________

2) We cannot see the Moon when it is a __________ Moon.

3) A __________ Moon appears 14 days after a new Moon.

4) The Moon has a much smaller __________ than the Earth.

5) You would weigh __________ times less on the Moon.

6) The smaller a planet is the __________ its gravitational force is.
Most of the energy that we use to heat our homes and to power our machines comes from FOSSIL FUELS. These are coal, oil and natural gas. It takes millions of years for fossil fuels to form from the remains of dead plants and animals. We say that they are NON-RENEWABLE because once we have used them up we cannot replace them. In the future we will need to rely more upon RENEWABLE energy resources (those that will not run out).

**Renewable energy resources.**

**Biofuels** - from plants and animals.

- Wood can be burnt.
- Alcohol can be made from plants and then used instead of petrol.

**Solar power**

- Solar panels and solar cells capture the Sun's energy. It must be a sunny day.

**Wind power**

- Sailing-boats use wind power to move them. Wind turbines are used to produce electrical energy. It needs windy weather.

**Wave power**

- The movement of waves on the sea can be used to drive generators. This is expensive to set up.

**Gravitational energy**

- Water is stored at a height in dams. As it rushes downhill gravitational energy is changed into moving energy. This can be used to turn turbines which produce electricity.

**Exercise** - Complete the sentences below.

1) Most of the energy we use comes from F _ _ _ _ _ _ fuels.

2) Fossil fuels are non-renewable because they cannot be R _ _ _ _ _ _ _ _ _ _

3) R _ _ _ _ _ _ _ _ energy resources do not run out.

4) Biofuels come from P _ _ _ _ _ and animals.

5) Weather conditions must be suitable to use W _ _ _ _ and solar power.

6) The energy in waves can be used but it is E _ _ _ _ _ _ _ _ _ _ to set up.
Most of the energy on Earth comes from the Sun. The diagram below shows how we can always trace energy resources back to energy from the Sun.

Exercise - Complete the sentences below.

1) Plants absorb the Sun’s E _ _ _ _ _ to make food.

2) Fossil fuels are formed from dead P _ _ _ _ _ and A _ _ _ _ _ _

3) S _ _ _ _ panels can be used to absorb heat directly from the Sun.

4) Solar C _ _ _ _ change light energy into electrical energy.

5) Winds are caused by H _ _ _ from the Sun.
Most people use electricity many times every day. Electricity is GENERATED (produced) in power stations before it is sent to homes and factories. A number of energy resources can be used to generate electricity. Large TURBINES that are connected to GENERATORS are made to turn. As the generators turn they produce the electricity. The diagram below shows how this works.

Many power stations burn coal to heat water. As the water boils steam is produced under high pressure. The turbines are pushed around by the force of the steam. Only about one third of the chemical energy inside the coal is changed into electrical energy. The other two thirds of the energy is lost to the surroundings as heat.

Some power stations use wind power to push the turbines around. In a HYDROELECTRIC power station water rushing downhill is used to turn the turbines.

Exercise - Complete the sentences below.

1) In order to generate electricity turbines must be made to _ _ _ _ 

2) In many power stations pressure from _ _ _ _ _ is used to turn the turbines.

3) Many power stations use _ _ _ _ as the fuel to heat water.

4) Coal powered electricity stations are wasteful because only about one _ _ _ _ _ of the chemical energy inside the coal is changed into electrical energy.

5) Hydroelectricity is generated by using energy from moving _ _ _ _ _

6) In the future _ _ _ _ _ and water power may become the main ways of generating electricity because they will never run out.
Energy changes.

There are several forms of energy. These are:

- **KINETIC ENERGY** - movement energy.
- **GRAVITATIONAL ENERGY** - energy stored in objects at a height.
- **ELASTIC ENERGY** - energy stored in stretched objects e.g. a spring.
- **CHEMICAL ENERGY** - energy stored in chemicals e.g. fuels, batteries and food. It is released by chemical reactions.
- **HEAT ENERGY**
- **LIGHT ENERGY**
- **SOUND ENERGY**
- **ELECTRICAL ENERGY**

Energy is always changing from one form into another. The diagram below shows the energy changes in a torch.

![Diagram of energy changes in a torch: CHEMICAL → ELECTRICAL → HEAT + LIGHT]

**Exercise** - Write down the energy changes for the objects below.

1) **GRAVITATIONAL** → ………………………

2) ……………………… → HEAT + ………………………

3) ……………………… → ELECTRICAL

4) **CHEMICAL** → HEAT → ………………………

5) ……………………… → SOUND
Answers to exercises.

Worksheet 1  Life processes.

Exercise 1  1) animals  2) energy  3) sensitivity  4) reproduce  5) excrete

Exercise 2  Processes a car does show  Processes a car does not show

movement  growth
nutrition (takes in petrol)  sensitivity
respiration  reproduction
excretion

Worksheet 2  Plant and animal organs.

Exercise 1  type organs body jobs healthy plants system intestines

Exercise 2  Brain
Heart
Leaf
Stomach
Flower
This pumps blood around the body.
This organ makes food in a plant.
This controls the rest of the body.
This organ makes seeds in a plant.
This helps to digest food.

Worksheet 3  Animal and plant cells.

Exercise 1  animals cells single millions types parts

Exercise 2  Cell part  Job

Nucleus  covers the membrane and gives strength to a plant cell.
Cytoplasm  controls what the cell does.
Cell wall  jelly that fills the cell, chemical reactions happen here.
Chloroplast  stores water in a plant cell.
Vacuole  absorbs light energy to make food for the plant.

Worksheet 4  Different cells for different jobs.

Exercise 1  nucleus different size adapted body job better

Exercise 2  palisade cell  ciliated cell  root hair cell  sperm cell
Answers to exercises.

Worksheet 5  A balanced diet.

Exercise 1  healthy  types  fats  correct  starch  energy  warm  protein  vitamins  intestines

Exercise 2  potato – carbohydrate,  fish – protein,  fruit – vitamins, minerals and fibre,
sausages – protein and fat,  whole grain bread – carbohydrate and fibre,
milk – protein and minerals,  chicken – protein,  cake – carbohydrate

Worksheet 6  Food and digestion.

Exercise 1  repair  energy  heat  cells  digestive  intestines

Exercise 2  clockwise from top right:
gullet  stomach  pancreas  small intestine  rectum  anus  appendix  large intestine
liver  gall bladder  salivary gland  tongue

Worksheet 7  Stages of digestion.

mouth  gullet  stomach  small intestine  pancreas  liver  large intestine  appendix  rectum

Worksheet 8  Blood.

plasma  red  dissolved  oxygen  germs  platelets  cut  scabs

Worksheet 9  The blood system.

1) vessels  2) veins  3) pump  4) heart  5) walls  6) cells  7) waste

Worksheet 10  Moving the body.

1) fibres  2) shortens  3) tendons  4) push  5) pairs  6) biceps  7) triceps

Worksheet 11  Growing up.

Exercise 1  children  puberty  body  attracted  hormone  changes  oestrogen

Worksheet 12  The human reproductive system.

sperm  tube  penis  duct  swim  urine  ova  month  oviducts  food

Worksheet 13  The menstrual cycle.

1.) month  2) ovulation  3) 14 days  4) feeds  5) die  6) uterus

Worksheet 14  Ovulation and fertilisation.

1) ovulation  2) fertilisation  3) oviduct  4) divide  5) cells  6) uterus

Worksheet 15  The developing baby.

1) foetus  2) amnion  3) protects  4) oxygen  5) waste  6) umbilical cord
Answers to exercises.

Worksheet 16  Breathing (1).

oxygen  trachea  cartilage  bronchus  alveoli  capillaries  blood

Worksheet 17  Breathing (2).

1) muscle  2) inhale  3) exhale  4) contract  5) volume  6) decrease  7) relax  8) increase

Worksheet 18  Keeping the lungs clean.

1) mucus  2) hairs  3) acid  4) beating  5) oxygen  6) cancer

Worksheet 19  Respiration.

Exercise 1  oxygen on left-hand side, water and carbon dioxide and on right-hand side

Exercise 2  1) energy  2) move  3) glucose  4) burning  5) carbon dioxide  6) breathing  7) oxygen

Worksheet 20  Drugs and health.

addict  reactions  alcoholic  liver  nervous  lung  hallucinate  dangerously  solvents

Worksheet 21  Germs and health.

1) inside  2) small  3) cells  4) poisonous  5) viruses  6) living  7) DNA

Worksheet 22  Fighting germs.

harmless  defend  skin  breathed  trachea  swallowed  stomach  phagocytes  eat  antibodies  vaccine  medicines

Worksheet 23  Photosynthesis.

1) food  2) light  3) leaf  4) carbon dioxide  5) chlorophyll  6) respiration  7) oxygen

Worksheet 24  Plant nutrition.

elements  dissolved  hair  stem  increase  magnesium  nitrogen  root

Worksheet 25  Classification.

groups  features  chlorophyll  roots  spores  cones

Worksheet 26  Flowering plants.

seeds  pollen  insects  nectar  scented  coloured  join  ovules  fruit  disperse

Worksheet 27  Animals without backbones (1).

1) vertebrates  2) invertebrates  3) tentacles  4) tapeworm  5) segments  6) snail  7) spines
Answers to exercises.

Worksheet 28  Animals without backbones (2).

1) arthropods     2) insect     3) six, four     4) eight     5) sting     6) shrimps     7) segments

Worksheet 29  Animals with backbones.

gills reptiles amphibians damp birds feathers wings mammals hair milk

Worksheet 30  Variation

1) variation    2) continuous    3) height    4) genes, environment    5) ovum    6) growth    7) minerals

Worksheet 31  Selective breeding.

1) changed    2) features    3) fastest    4) tallest    5) evolution    6) selection

Worksheet 32  A place to live.

Exercise 1  shark – ocean, buttercup – meadow, newt – pond, monkey – jungle, fox - woodland

Exercise 2  1) habitat    2) adaptation    3) waterproof    4) environment    5) water

Worksheet 33  Changing habitats.

Exercise 1  nocturnal hibernation migrate

Exercise 2  changing cold nocturnal food thicker fat energy

Worksheet 34  Food chains and pyramids of numbers.

plants animals eaten predators prey greater food fewer

Worksheet 35  Food webs.

TADPOLE    SMALL FISH

1) large fish, grebes    2) tadpoles    3) small fish, newts    4) water louse

5) tadpole, water snail, water louse    6) large fish, grebe

Worksheet 36  Poisoned food chains.

1) pesticides    2) chains    3) birds    4) poisoned    5) streams, ponds    6) biological

Worksheet 37  Populations.

population grow food greater die prey killed survive size deaths
Answers to exercises.

Worksheet 38  Solids, liquids and gases.

<table>
<thead>
<tr>
<th>Property</th>
<th>Solids</th>
<th>Liquids</th>
<th>Gases</th>
</tr>
</thead>
<tbody>
<tr>
<td>Density</td>
<td>High density</td>
<td><strong>High density</strong></td>
<td>Low density</td>

<tr>
<td>How easy are they to compress?</td>
<td>Hard</td>
<td><strong>Hard</strong></td>
<td>Easy</td>
</tr>
<tr>
<td>Do they flow?</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Do they keep the same shape?</td>
<td>Yes</td>
<td>No</td>
<td><strong>No</strong></td>
</tr>
<tr>
<td>Do they keep the same volume?</td>
<td>Yes</td>
<td><strong>Yes</strong></td>
<td>No</td>
</tr>
</tbody>
</table>

Worksheet 39  Changes of state.

DIFFUSION  A solid changing to a liquid.
ICE       The spreading out of particles.
MELTING   The solid state of water.
STATE OF MATTER  A solid, liquid or gas.
EVAPORATION A gas changing to a liquid.
CONDENSING A liquid changing to a gas.

Worksheet 40  Elements.

1) element  2) atom  3) nucleus  4) negative  5) positive  6) protons

Worksheet 41  The periodic table.

properties protons hydrogen oxygen reactive magnetic halogens noble two five

Worksheet 42  Compounds.

Exercise 1 C oxygen NaCl
Exercise 2 chemical physical chemical physical

Worksheet 43  Separating mixtures.

Filtration water sand paper
Distillation water cooled flask
Chromatography paper speeds

muddy water distillation
copper sulphate solution filtration
peas and sand magnetic attraction
iron filings and sawdust sieving
Answers to exercises.

Worksheet 44  Metals and non-metals.
Exercise 1  iron – metal   bromine – non-metal   copper – metal   sulphur – non-metal
Exercise 2  1) mercury   2) graphite   3) magnetic   4) metals

Worksheet 45  Changes of state.

1) gas   2) ethanol   3) sulphur   4) 119 °C   5) 1,540 °C   6) oxygen   7) lower

Worksheet 46  Solubility.
Exercise 1  dissolves solvent gloss water spirit
Exercise 2  1) dissolve   2) saturated   3) more

Worksheet 47  Expansion.

expand contract vibrate apart buckle snap thermometer scale

Worksheet 48  Rocks and weathering.

1) weathering   2) rain   3) sand   4) contraction   5) expands

Worksheet 49  The rock cycle.

sediments transported layers sedimentary mudstone metamorphic magma eruptions igneous

Worksheet 50  Types of rock.

1) magma   2) large   3) sediments   4) strata   5) crumble   6) heat   7) marble

Worksheet 51  Chemical reactions.
Exercise 1  1) equal   2) properties   3) heat   4) reverse
Exercise 2  ELEMENTS  The chemicals that are made.
                     PRODUCTS  The simplest substances.
                     COMPOUND  Starting chemicals.
                     REACTANTS  Elements joined together.

Worksheet 52  Types of chemical reaction.
Exercise 1  join breaks oxygen
Exercise 2  1) synthesis   2) decomposition   3) oxidation

Worksheet 53  Burning.

1) oxygen   2) carbon dioxide   3) energy   4) splint   5) fuel   6) air   7) heat
Answers to exercises.

Worksheet 54  Products from chemical reactions.

1) reactions  2) metal  3) carbon  4) mixture  5) nylon

Worksheet 55  Harmful chemical reactions.

rusting  water  coating  air  paint  oxidised  taste  cool  oxidation

Worksheet 56  Energy from chemical reactions.

1) energy  2) light  3) electrical  4) global  5) coal  6) acid

Worksheet 57  Reactivity of metals.

1) potassium  2) gold  3) acid  4) magnesium  5) gold  6) steam

Worksheet 58  Displacement reactions.

Exercise 1  COPPER + SILVER NITRATE → COPPER NITRATE + SILVER

(colourless) (blue)

Copper is more reactive than silver therefore it displaces silver in the solution.

Exercise 2  oxygen  copper  less

Worksheet 59  Acids and alkalis.

1) corrosive  2) metals  3) red, blue  4) strong  5) weak

Worksheet 60  Acids and metals

1) copper  2) salt  3) faster  4) hydrogen  5) explosive  6) hydrogen  7) acid  8) salt

Worksheet 61  Acids and bases.

1) base  2) alkalis  3) salt  4) chloride  5) oxygen  6) carbon dioxide  7) fizz

Worksheet 62  Neutralisation.

hydrochloric  indigestion  alkali  acidic  bicarbonate  vinegar  rain  limestone  powdered

Worksheet 63  Acid rain.

1) sulphur  2) coal  3) electricity  4) rain  5) die  6) minerals  7) metals

Worksheet 64  Electric current and voltage.

current  voltmeter  twice  brighter  positive  flow
Answers to exercises.

Worksheet 65  Series and parallel circuits.

Exercise 1  Bulbs in series  small  resistance  ammeter
            Bulbs in parallel  voltage  larger  bright

Exercise 2  1) go out  2) brighter  3) B

Worksheet 66  Electrical resistance.

- filament  current  resistance  heat  copper  more  high  size  lights  volume

Worksheet 67  Magnets.

Exercise 1  1) attract  2) repel  3) repel

Exercise 2  A and C

Worksheet 68  Electromagnets.

1) field  2) stronger  3) solenoid  4) more  5) electromagnet

Worksheet 69  Uses of electromagnets.

An electric bell, coil, arm, gong, off

Sorting scrap metal, steel, cable, off

Electromagnetic switches, relay, input, lever, contacts, output

Worksheet 70  Speed.

Exercise 1  1) 10 m/s  2) 120 km/h  3) 10 mph

Exercise 2  1) $S \times T = 40 \text{ mph} \times 3h = 120 \text{ miles}$

$2) \quad \frac{D}{S} = \frac{200m}{10\text{m/s}} = 20s$

Worksheet 71  Force and movement.

1) speed up
2) travel at a steady speed
3) slow down
4) move

Worksheet 72  Friction

friction  slip  rims  gravity  upwards  heat  reduced  grease  faster

Worksheet 73  Turning forces.

1) pivot  2) lever  3) turning force  4) crowbar  5) long
Answers to exercises.

Worksheet 74  Pressure.

1) 10,000N/m²   2) 2,500,000N/m²   3) 140N

Worksheet 75  Reflection.

1) luminous   2) torch, candle, glow worm, Sun, firework   3) reflection
4) diagrams are drawn to show that the angle of reflection = the angle of incidence

Worksheet 76  Refraction of light.

1) medium   2) refraction   3) slowly   4) speed   light rays traced back to where the coin appears to be

Worksheet 77  The spectrum.

1) spectrum   2) dispersion   3) red   4) violet
only the red light passes through the red filter but it does not pass through the blue filter.

Worksheet 78  Coloured objects in coloured lights.

<table>
<thead>
<tr>
<th>Item of clothing</th>

<tr>
<td>cochlea</td>
<td>pass the vibrations from the ear drum to the cochlea</td>
</tr>
</tbody>
</table>

Worksheet 80  Sound

Exercise 1  1) vibrating   2) waves   3) amplitude   4) frequency   5) higher   6) lower

Exercise 2  HIGH PITCH AND QUIET = C   HIGH PITCH AND LOUD = A

LOW PITCH AND QUIET = D   LOW PITCH AND LOUD = B
Answers to exercises.

Worksheet 81  Comparing light and sound
   1) faster  2) transparent  3) see, hear  4) medium  5) sound  6) light

Worksheet 82  Day and night.
   1) axis  2) day  3) towards  4) East, West  5) morning  6) midday

Worksheet 83  The seasons.
   1) orbit  2) year  3) summer  4) winter  5) towards  6) southern, summer

Worksheet 84  The solar system.
   1) Venus  2) Jupiter  3) longer  4) Mars  5) high  6) Saturn

Worksheet 85  Satellites.
   gravity  satellite  Moon  orbit  full  speed  Earth  telescope  air

Worksheet 86  The Moon and its phases.
   1) phases  2) new  3) full  4) mass  5) six  6) smaller

Worksheet 87  Energy resources.
   1) fossil  2) replaced  3) renewable  4) plants  5) wind  6) expensive

Worksheet 88  The Sun and energy resources.
   1) energy  2) plants, animals  3) solar  4) cells  5) heat

Worksheet 89  Generating electricity.
   1) turn  2) steam  3) coal  4) third  5) water  6) wind

Worksheet 90  Energy changes.
   1) GRAVITATIONAL  -->  KINETIC / MOVEMENT
   2) CHEMICAL  -->  HEAT + LIGHT
   3) LIGHT  -->  ELECTRICAL
   4) CHEMICAL  -->  HEAT  -->  KINETIC / MOVEMENT
   3) MOVEMENT  -->  SOUND
